

Automotive Grade Linux releases UCB 10 software platform

Automotive Grade Linux (AGL), an open source project developing a shared software platform for in-vehicle technology, has announced the latest code release of the AGL platform, UCB 10, also known under the code name 'Jumping Jellyfish'. UCB 10/Jumping Jellyfish includes an operating system, board support package, middleware, application framework and application APIs.

Dan Cauchy, executive director of Automotive Grade Linux at the Linux Foundation, said, "The AGL platform is Yocto-based, and for Jumping Jellyfish, we updated to Yocto's first long term support (LTS) release named Dunfell. This is significant as it means the Yocto Project will provide patches, fixes, and updates for an extended period of time, something that is essential for automotive systems, which have a longer life cycle than many other embedded Linux applications."

Automotive Grade Linux is a collaborative open source project. It aims to bring together automakers, suppliers and technology companies to accelerate the development and adoption of a fully open software stack for the connected car. It has Linux at its core, and it is developing an open platform from the ground up that can serve as the *de facto* industry standard to enable rapid development of new features and technologies.

selling on BigCommerce can create unique experiences that resonate with shoppers and streamline their path to purchase."

Developed in React, Open Checkout builds upon BigCommerce's Checkout SDK and starts development of bespoke features and use cases like branded checkout pages and modernised B2B buying, as well as adaption to new retail environments. Branded checkout pages design a cohesive brand experience throughout the customer journey by adding custom CSS rules and JavaScript applications. Modernised B2B buying helps to streamline B2B purchasing by inserting custom fields where buyers can enter account information, pay using a purchase order, or submit an order without collecting payment at checkout.

IntuitSolutions, a BigCommerce partner, is one of the first agencies to tap into Open Checkout to develop its Ebizio Checkout application, which includes six pre-built functionalities. Eric Hansen, chief marketing officer at IntuitSolutions, said, "Throughout our partnership with BigCommerce, IntuitSolutions' clients have greatly benefited from the custom applications we've been able to develop by building on top of an industry-leading checkout."

Datalogics Inc. announces .NET Core support for the Adobe PDF library SDK

Datalogics, Inc. has announced the release of .NET Core support for the Adobe PDF Library SDK. .NET Core is the next generation of the .NET development platform, is the successor to the .NET Framework, and is open source. It works on Linux and Mac, and allows cross-platform development using a .NET language like C#, for example. It includes support for things like Windows Forms applications, Console applications, Class libraries, ASP.NET, and WPF.

Scott Urchell, technical sales engineer at Datalogics, said, "With this new support, our APDFL developers/customers can take advantage of .NET Core's cross-platform support, and leverage their existing C# applications to new platforms with few or no changes to their code."

Datalogics is now shipping a .NET Core Class Library that targets v3.1 of the .NET Core, which is the latest version.
