

A peer-to-peer network helps applications and devices without a server to connect with each other. In comparison to the client-server model, no central server is required in P2P architecture for handling the requests.

Removable media: This includes the usage of external devices for file sharing without the need for any client-server architecture. Flash drive is a popular external or removal media. Users can copy or upload files into portable storage media from their computers, and then physically send them to where they want the files to be exchanged.

Online and cloud based file sharing: Cloud computing and Web based services are very popular for file sharing on the World Wide Web. These services enable users to store or exchange files on the Internet for

personal or corporate applications. The sender can upload the files in different formats to an online portal. The receiver can be provided a unique ID or link of that cloud storage. A range of free cloud storage solutions is available. Cloud computing is simple to access and provides up to 200GB of free storage space that can be used for both personal and corporate storage applications.

Storage of files on the cloud offers several benefits over conventional data storage solutions like disks, storage drives or other storage devices. For example, if the recorded data is compromised in some way, the files stored in devices may be destroyed. Cloud computing based file storage is effective. It can be used as an alternate to traditional file backup and sharing, as it ensures anytime-anywhere availability of data.

Cloud service URL

Cloud service	URL
WikiSend	wikisend.com
Blomp	blomp.com
FileBin	filebin.net
Degoo	degoo.com
Mega	mega.nz
Media Fire	mediafire.com
Yandex	disk.yandex.com
Google Drive	google.com/drive
IceDrive	icedrive.net
Koofr	koofr.eu
Mimedia	mimedia.com
Sync	sync.com
DropBox	dropbox.com
pCloud	pcloud.com
OneDrive	onedrive.live.com
iCloud	apple.com/in/icloud
Synplicity	synplicity.com/en
Letsupload	letsupload.io
Jumpshare	jumpshare.com

Table 1: Cloud services for secure file sharing

Two cloud services for secure file sharing

WikiSend

URL: WikiSend.com

Files in multiple formats can be shared on WikiSend at a high speed. The end users need only a Web browser regardless of the device, be it a mobile phone, tab or laptop. With the use of such platforms, cloud based file sharing becomes very easy and effective.

On uploading any file to WikiSend, a unique ID is generated for it. Using this ID, any user can download the file. This makes the overall process of file sharing secure and easy to use.

FileBin

URL: FileBin.net

The use of FileBin for uploading and sharing of files is quite easy too. Once a file or set of files is uploaded on the FileBin cloud, a unique URL is generated, which can be shared with the end users.
