

Filebin

Convenient file sharing on the web, without registration. Simply upload files and share the URL. The files will expire automatically 1 week from now.

1. Click **Upload files** below, or drag and drop the files into this browser window.

2. Wait until the file uploads complete.

3. Distribute the URL to share access to the files.

Figure 5: Downloading a file by using a unique URL

The receivers of files can access the documents by using any Web browser on any Internet connected device including a smartphone, laptop or a tab.

There are many other cloud based storage and sharing platforms that provide secure uploading and access of files and documents in multiple formats. Files are retained on the cloud and can be accessed directly. These files can be encrypted with passwords so that only authenticated users are able to view or download them.

The author is the MD of Magma Research and Consultancy, and is associated with various academic institutes for delivering expert lectures and conducting technical workshops on the latest technologies and tools.

Continued from page 51....

Protecting the network: By implementing conventional endpoint protection features such as antivirus and anti-malware software, encryption, and intrusion prevention and detection systems, IoT applications could be better secured.

Authentication: By incorporating multiple access management features for a specific IoT device, as well as good authentication mechanisms such as two-factor authentication, data encryption and fingerprint scanners, users can verify smart systems.

Security analytics tools: Using IoT security analytics tools could help identify IoT-specific attacks that conventional network security solutions, such as firewalls, cannot find.

Security methods: IoT API safety features can be used not only to ensure data transfer integrity among IoT devices, but also to ensure that potential attacks against specific APIs are identified only by approved devices, programmers and apps.

Designing secure applications:

Given the immaturity of the existing IoT technology, IoT application developers must emphasise the security component of their IoT applications. They should also do a complete analysis of the security of their IoT systems while designing them, and try their best to find a good balance between the user experience and the protection of their IoT applications.

Developing a security strategy:

Device and software developers need to be vigilant about the IoT security risks. Since IoT is still a new technology, security violations are bound to occur. All IoT software vendors and application developers should prepare for security vulnerabilities with a proper strategy.

The future

In the coming years, it is expected that security systems in IoT applications will

be much more stringent than they are now. Developers now understand the importance of privacy and security of data to enhance consumer satisfaction. Endpoint security monitoring and code signing with a higher degree of encryption will make data much more secure. This will ease the apprehensions of consumers. The higher speed of the Internet and the arrival of 5G will also help to make the private information of small to big firms secure and confidential.

Within a few years, almost all security threats in IoT applications will be removed because of the various measures mentioned in this article. But users must remain vigilant and knowledgeable enough to ensure the security of their data. IoT developers should also make users aware about any new threats, and train them on how to keep their data secure.
