JetBrains, the company that created an extended family of integrated development environments (IDE) for various programming languages, has announced the public launch of Space — an all-in-one collaboration platform for creative teams, including developers, marketing, design, HR, legal, and others.

Launched in an early access programme in December 2019, Space received over 35,000 requests from companies. Over the past year, users have sent around 1.5 million messages and have created more than 13,000 repositories.

JetBrains said that Space combines general collaboration tools like chats, team and project management, meeting scheduling and documents with workflows for specific verticals. It already covers the entire software development cycle, and the team will be adding domain-specific tools for other roles and departments in the future.

Over the past few months the team behind Space has enhanced all parts of the product, including chats, meetings, calendars, issues, mobile apps, launched documents, issue boards, automation CI/CD, personal to-do lists, and added turn-based code reviews.

Anna Vinogradova, CMO at AmberCore Software Ltd, a company specialising in developing tech products, said, “Before Space our developers often felt isolated from the rest of the team and didn’t play a deeper role in projects. We’ve been looking for a tool that would funnel everything into a single pool, and make it easy for team members to discuss their tasks with one another instead of sitting isolated in their repository. Space really makes things easier for our team.”

Bharti Airtel accelerates its open hybrid cloud network deployment

IBM and Bharti Airtel have completed the first phase of Airtel’s open hybrid cloud network, which has been built with IBM and Red Hat’s portfolio of hybrid cloud and cognitive enterprise capabilities. With this deployment, Airtel’s customers and ecosystem partners will have a flexible foundation to build and deploy innovative applications on the cloud network. They will also gain

Contributions to open source increased by 25 per cent in 2020: GitHub report

Over 56 million developers around the world are building on GitHub in 2020 as per the GitHub State of the Octoverse report. This includes more than 1.9 billion contributions added, and over 60 million new repositories created. Sixty-six per cent of active users are based outside of North America. According to the report, top languages for 2020 include JavaScript, Python, Java, TypeScript, C#, PHP, C++, C, Shell, Ruby, and Objective-C.

The report said that 35 per cent more repositories were created in 2020. There was increased development work—both time spent and amount of work—across all the time zones investigated. It’s unclear if developers are taking advantage of flexible work schedules, or stretching the same amount of work over a longer period of time. Developers may be taking advantage of flexible schedules to manage their time and energy, which contributed to this sustained productivity.

GitHub

As per the report, there were 25 per cent more contributions to open source projects in 2020. Developer work dropped on the weekends, while open source activity jumped. This could mean that open source is both a place to learn and create, and an important escape from work.

In 2020, open source contributors from the United States have dropped to 22.7 per cent, with more contributors coming from China (9.76 per cent), India (5.2 per cent), Germany (6.43 per cent), UK (4.51 per cent), France (3.52 per cent), Japan (2.49 per cent), and Australia (1.71 per cent).
