

repository that you want to test. After successfully performing this, you will be steered to the Snky dashboard, as shown in Figure 2, and will be able to see your project's report here. As we can see, the project was successfully processed and four high, three medium, and zero low vulnerabilities were reported.

The full report of SAST is shown in Figure 3. The count and description of vulnerabilities and bugs are shown according to their severity, along with the vulnerable pull requests (PR).

Figure 4 shows an issue of remote code execution. This is one of the many vulnerabilities in the project. The report describes its severity and nature of the exploit. It shows the module that introduced this issue and the detailed paths. In the end, it suggests some ways of fixing the issue.

Now, let us move to the second way — consolidating with Jenkins and testing as a Jenkins job. For using Snky from the command line interface (CLI), we require curl, node.js, and npm installed. Run the subsequent commands to install Snky:

```
$ sudo apt-get install curl
$ curl -sL https://deb.nodesource.com/setup_12.x | sudo -E bash -
$ sudo apt-get install nodejs
$ sudo npm install -g snky
$ snky auth
```

A link in the browser will pop open and will ask you to authenticate. After authenticating, run the following command for installing *snky-to-html*, which will be used for report generation in HTML format:

```
$ sudo npm install snky-to-html -g
```

Go to Jenkins (localhost: 8080) and navigate to 'Manage Plugins'. Go to the *Available* tab and search for 'Snky Security' and 'HTML Publisher' plugins. Install these plugins, and then create a freestyle Jenkins project with

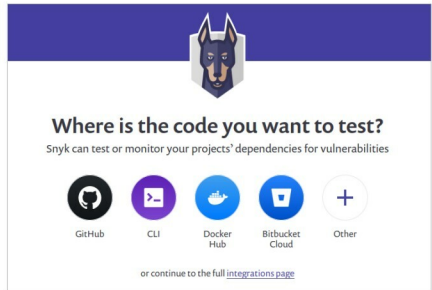

Figure 1: Select source code location

the configuration given below:

Source Code Management: git
repository URL of your project
Build: Select Execute Shell and write in text box

```
cd $(WORKSPACE)
echo "snky test && snky monitor" >
snky.sh
chmod +x snky.sh
/bin/bash snky.sh || true
snky test --json | snky-to-html -o
results.html
```
