Figure 7: Build Success of Java project

Figure 8: Analysis report of Java project

- Unzip the downloaded sonar-scanner file into any location on your system:
\$install_location for upcoming steps.
- Now, we must re-equip the global settings to locate the SonarQube server by modifying (if not already modified):

```
$install_location/conf/sonar-scanner.properties
```

Next are the contents of this file:

```
#Configure here general information about the environment, such as
#SonarQube server connection details for example
```

```
#No information about specific project should appear here
```

```
#---- Default SonarQube server
#sonar.host.url=http://localhost:9000
```

```
#---- Default source code encoding
#sonar.sourceEncoding=UTF-8
```

- Now, we must update the path environment variable by adding the \$install_location/bin directory to it.
- You can confirm your installation by executing the following command on a new shell:

```
$ sonar-scanner -h
```

- Now run the command created by SonarQube from your project's root location to initiate the inspection:

```
$sonar-scanner \
  -Dsonar.projectKey=feedback -Dsonar.sources=. \
  -Dsonar.host.url=http://localhost:9000 \
  -Dsonar.login=3fe1d8ed5a4931eff32602004bcd8c6dd7f15f13
```

The output of successful execution is shown in Figure 10.

The detailed analysis of your code is available at localhost: 9000. Figure 11
