

Red Hat and GitHub team up to expand the developer experience on Red Hat OpenShift

Red Hat and GitHub have announced extended collaboration between the two companies, emphasising Red Hat OpenShift through GitHub Actions and more. Red Hat is adding Red Hat GitHub Actions to the GitHub Marketplace, bringing GitHub's DevOps, continuous integration/continuous development (CI/CD) and developer workflow automation tools to Red Hat OpenShift. It said that this will give greater freedom to how developers can build and deploy applications on Red Hat OpenShift across the open hybrid cloud. GitHub Actions on Red Hat OpenShift are available now via GitHub Marketplace.

Using GitHub's built-in powerful, flexible CI/CD solution, GitHub Actions puts automation directly in the developer path. It makes it possible for nearly any event in a GitHub repository, like a pull-request or issue comment, to trigger workflows that can build and deploy applications across an IT environment and automate nearly any process in the software life cycle.

Red Hat OpenShift now supports GitHub Actions, enabling organisations to standardise and scale their use of open, standardised developer toolchain components like Quay, Buildah, or Source-to-Image (s2i). This will provide greater choice and flexibility to OpenShift customers in how they build and deploy applications. The new GitHub Actions for Red Hat OpenShift, along with existing actions on GitHub Marketplace and action workflows, makes it possible to achieve simple as well as complex application workflows on Red Hat's enterprise Kubernetes platform using an extensive array of standards-based tools.

enhanced performance, availability, automation and scaling, all the way from the core to the network edge, as per the company.

Telecom operators worldwide are expected to spend over US\$ 111 billion by 2022 upgrading their network cloud and platform. Airtel has been working with

IBM to integrate end-to-end advanced automation, and plans to embed AI capabilities in the future as a core part of its network transformation. In this first phase, IBM and Airtel have co-developed a 'single click' automated hybrid cloud design and deployment capability, and 'light touch' operations.

Steve Canepa, global managing director, communications sector and worldwide head of telecommunications, Media & Entertainment Industry, IBM, said, "Telco companies are at an inflection point in modernising their networks, and harnessing an open hybrid cloud architecture is fundamental to driving the scale, cost efficiencies and innovation they need. Together with Bharti Airtel, our most recent automation benchmarks have demonstrated our approach can shorten RAN service deployment times from weeks to a few days — compelling improvements in innovation for Bharti and their customers."

IBM Services is setting up the infrastructure, designing and implementing Airtel's open hybrid cloud network and executing overall programme management.

Headwind MDM releases open source remote control software for Android

Headwind MDM has announced the official release of aPuppet, which it says is the world's first open source Android remote control software created specifically for Android users. The software is compatible with any Android device running

Android 7 and above, and can be run on custom Android OS builds such as AOSP, GrapheneOS, LineageOS, etc.

The company said that the free version of the software comes with features such as open source server and agent, self-served setup, manual configuration of devices, and free LetsEncrypt certificate. The premium version comes for US\$ 590/year and offers advanced features to function as a turnkey solution for businesses.

Vsevolod Mayorov, the CEO of Headwind MDM, said, "Open source solutions such as Apache or MySQL have been dominating the traditional Web services market for a while. However, the services for mobile devices are mostly proprietary. I feel there is a great potential for

open source solutions in the mobile market, particularly in corporate mobile device management. We have experienced an increasing popularity of our open source MDM software 'Headwind MDM' and have already received numerous enquiries about a remote control for mobile phones. This is what led us to create aPuppet, and I am sure it will be a huge success."
