

DevSecOps: Integrating a Dynamic Application Security Testing Tool with Jenkins

In this article, the authors propose a method to integrate the OWASP ZAP DAST tool with Jenkins to publish reports on the vulnerabilities found in a Web application 'IITB feedback' and corresponding solutions. The source code of the project is available at <https://github.com/RahulSapparapu/iitbfeedback/>.

The Web application accepts student ratings about a professor and saves each response in an SQL database. The authors use the open source tool OWASP ZAP to integrate with Jenkins for easier manual or automatic security testing, which can be helpful for both beginners and professional Web application developers.
