

Headwind MDM is an open source platform for mobile device management. It supports Android devices including special-purpose devices (kiosks, TV boxes, data collection terminals, etc).

Most customers install the software on their own servers, which provides guaranteed privacy of mobile device management. The aPuppet project is integrated into Headwind MDM as a remote support plugin, and the remote control is initiated by a few mouse clicks in the control panel.

SUSE completes acquisition of Rancher Labs

SUSE has announced that it has closed the acquisition of Rancher Labs. It added that the combined company will bring together a best-in-class Linux operating

system, a market-leading Kubernetes management platform, and a host of pioneering edge capabilities that will give enterprises the power to innovate everywhere.

SUSE CEO Melissa Di Donato said, "Our customers have made it

clear they want powerful technology that is both leading-edge and reliable to accelerate business transformation. We have historically delivered innovative solutions that anticipate what enterprises need, and today with Rancher, we are set to make history again. With our powerful and modular approach to open source software, our customers can count on reliability and unmatched agility to innovate everywhere – from the data centre, to the cloud, to the edge and beyond."

Recently, SUSE announced a fourth quarter that saw continued global growth. Cloud ACV (annual contract value) bookings continued with 87 per cent growth, achieving 15 consecutive quarters of year over year cloud ACV increase. It also saw a 21 per cent increase year over year in customer deals worth more than US\$ 1 million.

Sheng Liang, former Rancher CEO and the new president of engineering and innovation at SUSE, said, "I knew SUSE was the right company for us because of our shared ethos, viewpoint and philosophy of open source driving value to business leaders. Together, we are committed to making a significant impact on enterprise business across the globe, supporting each and every customer as they navigate cloud solutions and modernise infrastructure in a way that makes sense for their workflows."

Logz.io announces US\$ 23 million funding round

Logz.io has announced a new US\$ 23 million funding round led by Pitango Growth. The new financing round, which includes participation from Logz.io's existing investors, will be used to further accelerate Logz.io's growth and advance its mission to provide customers around the globe with the best-of-class open source observability tools on a unified SaaS platform, as per the company.

Tomer Levy, CEO and co-founder of Logz.io, said, "Our mission remains the same since our founding. We help modern engineering teams transform their businesses by enabling better performing infrastructure and applications. We are excited to continue to partner with Pitango Growth and our existing investors who share our vision of how observability is the key for a successful digital business."

The latest funding round brings the total capital raised by Logz.io to more than US\$ 120 million, including US\$ 74 million raised over the last 18 months.

Oracle announces availability of integrated analytics engine for MySQL Database Service

Oracle has announced the availability of the Oracle MySQL Database Service with integrated MySQL Analytics Engine, optimised for and exclusively available in Oracle Cloud Infrastructure (OCI). It said that the MySQL service provides customers with a single, unified platform for Online Transaction Processing (OLTP) and Online Analytics Processing (OLAP) workloads, helping them build and run modern applications faster and more securely.

The company said that the MySQL Analytics Engine, developed for the MySQL Database Service by Oracle's MySQL engineering team in collaboration with Oracle Labs, is a new, in-memory analytic accelerator that scales to thousands of cores, supports real-time analytics, and is at least two times faster and up to 66 per cent less expensive than Amazon Redshift.

While MySQL databases are commonly used for OLTP, most enterprises that run these databases also need to run analytics on the data stored in them. Until today, organisations had to extract, transform, and load (ETL) their data into a separate analytics database — a costly and complex process that reduces performance, security, and data quality.

The MySQL Database Service is a fully managed database cloud service that enables customers to provision MySQL databases in minutes and focus on development, without having to worry about time-consuming database administration tasks such as scaling, backup, OS patching, and server maintenance. This is the only public cloud service built on MySQL Enterprise Edition to help ensure reliability and security, claims the company. The new service is completely compatible with on-premises MySQL.
