

To save a DataFrame to the Excel file, use the `to_excel` method:

```
1. #Write Data Frame to Excel
2. resultData.to_excel('Results.xlsx', index = False,
    header=True)
```

To get specific column data from a DataFrame, use `auditStatus["Audit Status"]`.

Creating a pivot table using Pandas

We will create a spreadsheet-style pivot table as a DataFrame using `pivot_table`. We will add values in the `properties` file to create pivot tables, as follows:

```
1. [FileLocations]
2. master.filename=project-data.xlsx
3. auditstatus.filename=audit-status.xlsx
4. [Pivot]
5. index-level-0=Project Manager
6. index-level-1=Project Manager, Domain
7. index-level-2=Project Manager, Domain, Technical Architect
8. columns=Audit Status
9. values=Project Id
```

Let's create a pivot table using a single column index (see Table 3):

```
1. pivot = pd.pivot_table(resultData, index=config.
get('Pivot', 'index-level-0').split(','), columns=config.
get('Pivot', 'columns').split(','), values=config.
get('Pivot', 'values'), aggfunc=len, margins=True, fill_
value=0)
2. print(pivot)
```

Project manager	Domain	Technical architect	Completed	Pending	All
Jayesh P	Banking	Ruby V	0	1	1
	Commerce	Ashish B	1	0	1
Mukund	Commerce	Jigisha P	1	0	1
	Insurance	Saurabh S	0	1	1
Radhika M	Aerospace	Shreyansh N	1	0	1
		Aish P	0	1	1
	Banking	Ramesh N	0	1	1
		Approva S	0	1	1
	Insurance	Shreyansh N	0	1	1
		Jigisha P	1	0	1
All			4	6	10

Table 5: Pivot table with three indexes

Project manager	Completed	Pending	All
Jayesh P	2	1	3
Mukund	1	1	2
Radhika M	1	4	5
All	4	6	10

Table 3: Pivot table with one index

Now let's create a pivot table using two-column indexes (see Table 4):

```
1. pivot = pd.pivot_table(resultData, index=config.get('Pivot',
'index-level-1').split(','), columns=config.get('Pivot',
'columns').split(','), values=config.get('Pivot', 'values'), agg
func=len, margins=True, fill_value=0)
```

Project manager	Domain	Completed	Pending	All
Jayesh P	Banking	0	1	1
	Commerce	2	0	2
Mukund	Commerce	0	1	1
	Insurance	1	0	1
Radhika M	Aerospace	0	2	2
	Banking	0	2	2
	Insurance	1	0	1
All		4	6	10

Table 4: Pivot table with two indexes

To create a pivot table using three-column indexes (Table 5), type:

```
1. pivot = pd.pivot_table(resultData, index=config.get('Pivot',
'index-level-3').split(','), columns=config.get('Pivot',
'columns').split(','), values=config.get('Pivot', 'values'), agg
func=len, margins=True, fill_value=0)
```
