

Ashnik extends open source services with Redis Labs in Southeast Asia and India

Ashnik has announced expanded open source database-based services through a new agreement with Redis Labs for Southeast Asia and India. Redis Labs is the home of Redis, which delivers instant experiences in a highly reliable and scalable manner for organisations ranging from high-growth startups to large enterprises and government agencies.

By extending the partnership for this region, both Redis Labs and Ashnik aim to focus on further supporting the explosive demand for Redis – in particular as a fully managed database-as-a-service (DBaaS).

“Southeast Asia and India are important APAC markets that will present a lucrative growth opportunity for Redis Labs. Singapore, a regional hub for many global organisations, is going to be the key focus area for us. One of the opportunities we see in the region is to work with customers who are looking for the right-fit open source solutions, and we believe that we can add value with Redis Labs’ robust modern data models and high-performance capabilities,” said Sandeep Khuperkar, Ashnik’s CTO and director.

“Redis is extremely popular among developers throughout Southeast Asia, and we’re seeing a great demand from their organisations to grow into an enterprise-grade Redis platform to power their critical, data-intensive applications. We’re thrilled to work with a consultancy such as Ashnik, who is a leader in delivering customer success through open source and cloud-native technologies. Ashnik will enable our customers to not only ensure they have the best Redis experience but also do more with Redis Enterprise,” said James Calvert, senior director, strategic alliances and partnerships at Redis Labs.

He added, “With Kubernetes usage on the rise, too many production workloads lack adequate data protection. Now, central teams can securely and seamlessly incorporate Kubernetes protection into their existing policies,

while enabling application owners to recover, migrate, and clone applications when necessary.”

“Now, instead of adopting yet another point backup tool

specifically for Kubernetes, businesses can protect Kubernetes applications and their underlying infrastructure within Druva alongside their existing workloads,” read Druva’s official statement.

Lenovo Data Center Group releases cloud-based business agility solutions

Lenovo Data Center Group (DCG) has announced a range of new and updated hyperconverged infrastructure (HCI) solutions and Lenovo Cloud Services to enable customers to keep pace with evolving business needs.

To keep up with the new normal, businesses need to adopt a hybrid cloud strategy and modernise their data centre infrastructure. Lenovo is addressing this by delivering an open platform of hyperconverged infrastructure solutions in partnership with Nutanix, Microsoft and VMWare, and expanding software-defined systems management capabilities with Lenovo XClarity.

Lenovo, in collaboration with Nutanix and AMD, has announced the new Lenovo ThinkAgile HX HCI solutions powered by AMD EPYC processors,

enabling customers to run their virtual desktop workloads and maintain consistent performance (in the same 1U form factor), with up to 50 per cent fewer servers.

Lenovo, in collaboration with Microsoft, has recently announced the new Lenovo ThinkAgile MX Azure Stack HCI Edge and Data Center Solutions, enabling customers to rapidly deploy hybrid cloud infrastructure.

Lenovo offers customers a one-stop shop for Azure Stack HCI with the new ThinkAgile MX appliances, providing easy deployment, management, and scalability of Azure services from edge-to-core-to-cloud. In addition, it plans to offer a consumption-based (pay-as-you-go) pricing of Azure Stack HCI and Azure Stack Hub.

ThinkAgile MX has a single, simplified console for life cycle management and delivers an enhanced customer experience, so customers can easily modernise and scale their on-premise infrastructure from edge solutions to the cloud.
