

free, even for commercial usage under the LGPL open source software licence. The Duplicati backup software can be installed on Windows, macOS, and Linux operating systems. The Web interface is supported by any browser. You can access the interface on the go from any location.

You can save money by using cloud backup solutions rather than traditional methods of storage like hard disks, USBs, etc. You can also save time with automatic scheduling of the backup, which is a feature of Duplicati. The data is much more secure with client-side encryption than traditional backup solutions.

Drawbacks of Duplicati

Weak support: As it's open source, it lacks a dedicated team of support technicians for solving your problems, but there is an active forum where you can ask for help.

Harder for laymen: Duplicati tends to be for more advanced users, who may be developers or have system administration experience.

No mobile apps: There are no mobile apps; so those who want to access their backup on the go should look elsewhere.

Installation of Duplicati

Download Duplicati from the link at: https://updates.duplicati.com/beta/duplicati-2.0.5.1_beta_2020-01-18-x64.msi. Install it by accepting the terms and conditions, and disable the *launch startup* option. Duplicati is successfully installed.

Now, we need to install Duplicati as a service. Open a command prompt with administrative privileges, and then go to the folder location of Duplicati:

```
cd \Program Files
cd Duplicati 2
```

```
Duplicati.WindowsService.exe install
--webservice-interface=loopback
--webservice-port=8200 --portable-mode
```

To access Duplicati from a remote computer, use `--webservice-interface=any` and after that, specify a listening port with `--webservice-port={port no.}`. Duplicati stores the local databases in the program folder with `--portable-mode`.

Let's check if the Duplicati service has been created successfully by accessing the *services* menu from the command line. In the *services* menu, search for 'Duplicati Service' and right-click the service to start it:

`Services.msc`

When the Duplicati service is started, you can access the Duplicati interface with `http://127.0.0.1:8200`

```
Microsoft Windows [Version 10.0.18363.1082]
