Figure 7: Schedule backup

If all required fields are filled in, you can optionally click the *Test connection* button. Duplicati will try to connect to the backend using the provided information.

You can use any remote file server or cloud storage services like Google Drive or Mega for storing backups.

Step 3: Select the files and folders that you want to include in the backup. This can be done by selecting files and folders in the file picker. Here, we have backed up five image files from the my pictures folder.

Step 4: Schedule your backups. Selecting automatically run backups enables scheduling for this backup job. If you keep this enabled, you can specify how frequently and at what time the backup should be started. You can also exclude one or more weekdays.

Step 5: Set the upload volume size and how many backups should be available for restore operations.

Click on the *Save* button. You have successfully created your first backup.

Restoring files from a backup

Let's delete two images (pic 1 and pic 2) from the *my pics* folder and try to restore them.

The restoration consists of two steps.

Step 1: Specify what you want to restore, and from which restore point you want to restore these files.

In the file browser, select all the files and folders you want to restore. Selections will be marked with a green checkmark. Here, I have selected two images (pic 1 and pic 2) that I want to restore from my backup.

Step 2: You can choose the location where you want to restore the files and give some options for the restore operation. Now, let's restore the files to their original location.
