

Moodle Plugins for Online Education: The Joy of Learning

This is the third and final article on Moodle plugins for online education. The first two articles discussed two plugins, Interactive Content – H5P and BigBlueButtonBN. These plugins are immensely useful in setting up online content for college-level courses, where the targeted audience is mostly self-motivated. This last article in the series introduces four Moodle plugins that will help teachers design school level courses, keeping in mind the short attention span of the forever energetic and enthusiastic children in schools.

A course with just live video conferences and recorded videos with interactive content would definitely bore children. Endless video lectures at this point are not conducive to good teaching, so it is essential that online courses meant for children should contain as many fun activities as possible. But at the same time, the most challenging aspect of teaching is to convert education into edutainment. The last part of the title of this article ‘The Joy of Learning’ is not the name of any plugin; rather, it signifies the inalienable right of every child to education across the world.

In the earlier articles in this series, we learned to install a local copy of Moodle in our systems, and add users

and courses to it. So, it is highly recommended that you have a local copy of Moodle installed in your system before trying out the different plugins discussed in this article. We have also created courses called H5P101 and BBB101 along with three users — an admin, a user called *Guru* (a teacher) and a user called *Shishya* (a student) in the local copy of our Moodle. We will create a new course called Moodle101, and add the user *Guru* as a teacher and *Shishya* as a student to this course.

In this article, we will discuss four Moodle plugins that will help us to create fun-filled online courses. Since we are discussing four plugins, we have omitted some obvious steps

involved in the installation and usage of these plugins to save print space. But if you have any doubts or need more information regarding the use of these plugins, we will be glad to address them.

MooTyper

Maintained by AL Rachels, MooTyper is a Moodle plugin used for typing practice. Though typing is not a part of the school curriculum, it is a useful skill that should be learned. It also allows a student to take a break from monotony. Of course, the teachers can also make sure that the students are indeed typing important essays rather than copy-pasting them. The zipped installation file of the plugin
