

Quizventure is a Moodle plugin that loads quiz questions from the course, and the multiple-choice answers come down as space ships in an arcade video game. Students have to shoot the correct option to proceed to the next level. Notice that this activity can be repeated until the students get all the answers correct. This makes them learn and remember important questions. However, such interactive activities should only be used for learning and not for evaluation. The plugin Quizventure is maintained by John Okely and Stephen Bourget. The installation file for the plugin called *mod_quizgame_moodle39_2018062004.zip* is available at https://moodle.org/plugins/mod_quizgame.

After the installation of the plugin by the *admin user*, the teacher of the course Moodle101 can create a game as an activity and connect a quiz with it. Here, we are using the same quiz name 'Sample Quiz' with the single question created earlier (Figure 5). The user *Guru* should click on the link named 'Add an activity or resource' to add a Quizventure activity. The plugin is shown inside a bold blue rectangle in Figure 1. Now, let us set up a Quizventure game in our Moodle course by clicking on this button. You need to provide details like name ('A Short Quiz') and the name of the quiz (here, 'Sample Quiz') to be associated with the game. After providing these, press the button 'Save and return to course'. Figure 2 shows the short quiz activity just created (marked with a bold blue arrow mark). Now log out as the user *Guru* and log in again as the user *Shishya*. Now go to the course page of Moodle101, where you will see a link to the game. Click this link to start the game. In the game, a participant can earn or lose points based on the answers chosen. Figure 6 shows the screenshot of a Quizventure learning game, halfway through.

Custom certificate

As we grow older, we tend to appreciate less and less of what we receive. A chocolate would have made us rejoice

Figure 6: A Quizventure game

when we were young. The same chocolate will not make most of us happy when we are forty. For school children, a certificate appreciating their achievements (even a small achievement), will definitely be a great source of joy. Custom certificate is a plugin that can be used to automatically generate certificates for the participants of a course. This plugin is maintained by Mark Nelson. The installation file for the plugin, called *mod_customcert_moodle39_2019111804.zip*, is available at https://moodle.org/plugins/mod_customcert.

After the installation of the plugin by the admin user, the teacher of the course Moodle101 can create a certificate and add it as an activity to the course. Since it is a certificate, it would be better that the activity (certificate) is available only at the end of the course. Figure 2 shows the custom certificate plugin (marked with a bold yellow rectangle) from a list of Moodle activities. Now, let us start creating a certificate for our Moodle course by clicking on this button. You need to provide details like the name (in this case *Download Your Certificate*) to be shown on the course page.

The teacher can decide the eligibility criteria for obtaining a certificate. The certificate can either be issued to students who complete a certain percentage of activities in the course, or to everyone after the completion of the course. We recommend the latter, so that every student gets a certificate.

After all, it is an automatically generated certificate, and why can't every child have one irrespective of his or her academic prowess? After providing these essential details, press the button 'Save and return to course'. Figure 2 shows this newly created certificate as an activity link (marked with a bold yellow arrow mark). Now, we need to design the certificate. Click on the name of the certificate (in this case *Download Your Certificate*) and then choose the option 'Edit certificate' from the settings. First, we need to add the elements (entries) that should be shown on the certificate. For example, the name of the school, name of the course, name of the teacher, name of the student who receives the certificate, etc, should definitely be present.

The certificate could also have content like background image, image (which can be used to include the logo of the school, if required), border, QR code, the grade of the student, etc. While adding the element 'student name', the teacher doesn't need to add the names of individual students. The plugin will automatically generate the student name in the certificate from the Moodle login name of the student. A teacher also has the options of changing the size, style and colour of the elements in a certificate.

After adding all the details (elements) required in the certificate, we need to fix the position of these elements in the certificate. Click on the link 'Reposition elements'. A teacher can drag and
