

	The benefits of implementing continuous delivery and continuous deployment practices in the organisation are: • Accelerate application delivery • Faster time to market with continuous feedback • Productivity gains • Easy rollback	A few tools related to continuous delivery and continuous deployment are: • Plugins • Shell script • Batch script • App centre • TestFlight
Continuous testing	Continuous testing helps to verify the functional aspects of an application in an automated manner and keeps it production-ready after all verifications. It is the process of executing automated tests as part of the software delivery pipeline, in order to obtain feedback on the business risks associated with a software release candidate as rapidly as possible. The benefits of implementing continuous testing practices are: • Bring quality and improvement as a part of the continuous process or pipeline • Help to detect issues in the early stages • Accelerate application delivery • Faster time to market with continuous feedback • Improve test coverage • Transparency	The tools that can be used for continuous testing are: • Selenium • Appium • Apache JMeter • OWASP ZAP • Cucumber
Continuous monitoring	Continuous monitoring practice helps to monitor applications as well as infrastructure irrespective of production or non-production environments. The objective is to fail early when the impact will not be high. Continuous monitoring should be part of the DevOps pipeline and not an afterthought or a scheduled event that takes place once in a while. The benefits of implementing continuous monitoring practice in the organisation are: • Happy end users • Early identification/detection of failures • High availability if detection leads to resolution of issues based on matured processes • Proactive measures to make application and environment highly available and fault-tolerant	The tools related to continuous monitoring are: • Azure DevOps • Cloud-Native tools • Jenkins plugins • New Relic – application monitoring
Continuous improvements/innovations	Continuous improvements in the mindset and existing practices are essential to build a better organisational culture. This is the responsibility of all stakeholders, including project teams.	

Table 3: Continuous practices

Azure DevOps

Azure DevOps is a Software as a Service (SaaS) or hosted service, which was formerly known as Visual Studio Team Services. This platform from Microsoft provides an end-to-end automation toolchain for developing and deploying different types of applications written in Java, .NET, Python, PHP, Angular, Node.js, Ionic Cordova, Android, iOS, and

so on. It also integrates with most of the tools used in the automation of application life cycle management activities. It offers a free trial to get started. The hosted Mac agents provided by Azure DevOps can be helpful in building iOS applications. Do visit <https://azure.microsoft.com/en-in/services/devops/> for more details.

Table 4 will help you understand Azure DevOps services.
