

digikam also has other filter options, like fuzzy searches to find similar images, a sketch search to try to match a photo with a rough drawing of what you're looking for, and more.

Editing and effects

digikam has a built-in editor for most common photo effects and touch-ups. To use these effects, select any photo and click the *Image Editor* button at the top toolbar. This opens a new window for dedicated editing. In the *Image Editor* interface, you can start editing your photos by using the functions. You can use these functions by selecting the effect from the window menu or the *Select Tool* button in the top toolbar.

digikam offers all the usual effects like colour balance, saturation, levels, red-eye removal, and so on. Special effects are included too, such as textures, oil paint filters, borders, film grains, film emulation, and many more. You can try all of them as they are free, and these changes will not alter your photos until and unless you save the changes. Every filter and edit can be undone from the edit menu, but only in the order these were applied. As an example, if you have used a colour balance filter and then used vivid effect, you can remove the latter only after removing the former. So it works in a first in first out manner. To see the effects that are applied on a picture, click the visioning tab on the right side of the *Image Editor* interface and then select the *Used Filter* tab.

Once you are finished with the editing and selecting the effects, save the changes directly to your original photo, or make a copy of it and then save it. You also have the option to view the earlier version of your photo from the thumbnail view if you have made changes in the original photo.

Exporting

Exporting pictures from digikam is automatic and very simple. In fact, all the editing and effects that you

apply on any picture are saved in the same directory/album that you have selected. Also, any copy you make of the original photo will get saved in the same directory by default.

digikam also has handy export options, depending on how you set it up. Certain export options require additional libraries that you may or may not ever need. You can choose any of these for exporting libraries, like Piwigo, email, Flickr, Google Photos, Google Drive, Facebook, MediaWiki, SmugMug, raw HTML, Debian Screenshots, any remote computer you have an account on, and many more.
