

- **Default:** Provides a default value for a column when none is specified.

Data integrity

- **Entity integrity:** There are no duplicate rows in a table.
- **Domain integrity:** Applies valid entries for a given column, limiting the type, format or range of values.
- **Reference integrity:** Rows cannot be deleted; other records use them.
- **User defined integrity:** Implements certain business policies that are not related to the integrity of the entity, domain, or reference.

```
CREATE TABLE table_name (
    column1 datatype constraint,
    column2 datatype constraint,
    .
    .
    columnN datatype constraint,
    PRIMARY KEY (one or more columns)
);
```

To execute the query, go to F9 (Figure 5).

In the next article, we will see how to insert data in a table, fetch specific records and delete/alter tables. We will also look at various operations on the tables, see how to use most common

ID	Name	AGE	STATE	SALARY
1	Harry	32	California	30000
2	John	25	Florida	40000
3	James	23	Texas	50000
4	Leo	25	Alaska	62000
5	Anna	27	Michigan	22500
6	William	22	Washington	28000

clauses such as WHERE, GROUP BY, HAVING; and learn how to join two or more tables. **END** 🐧

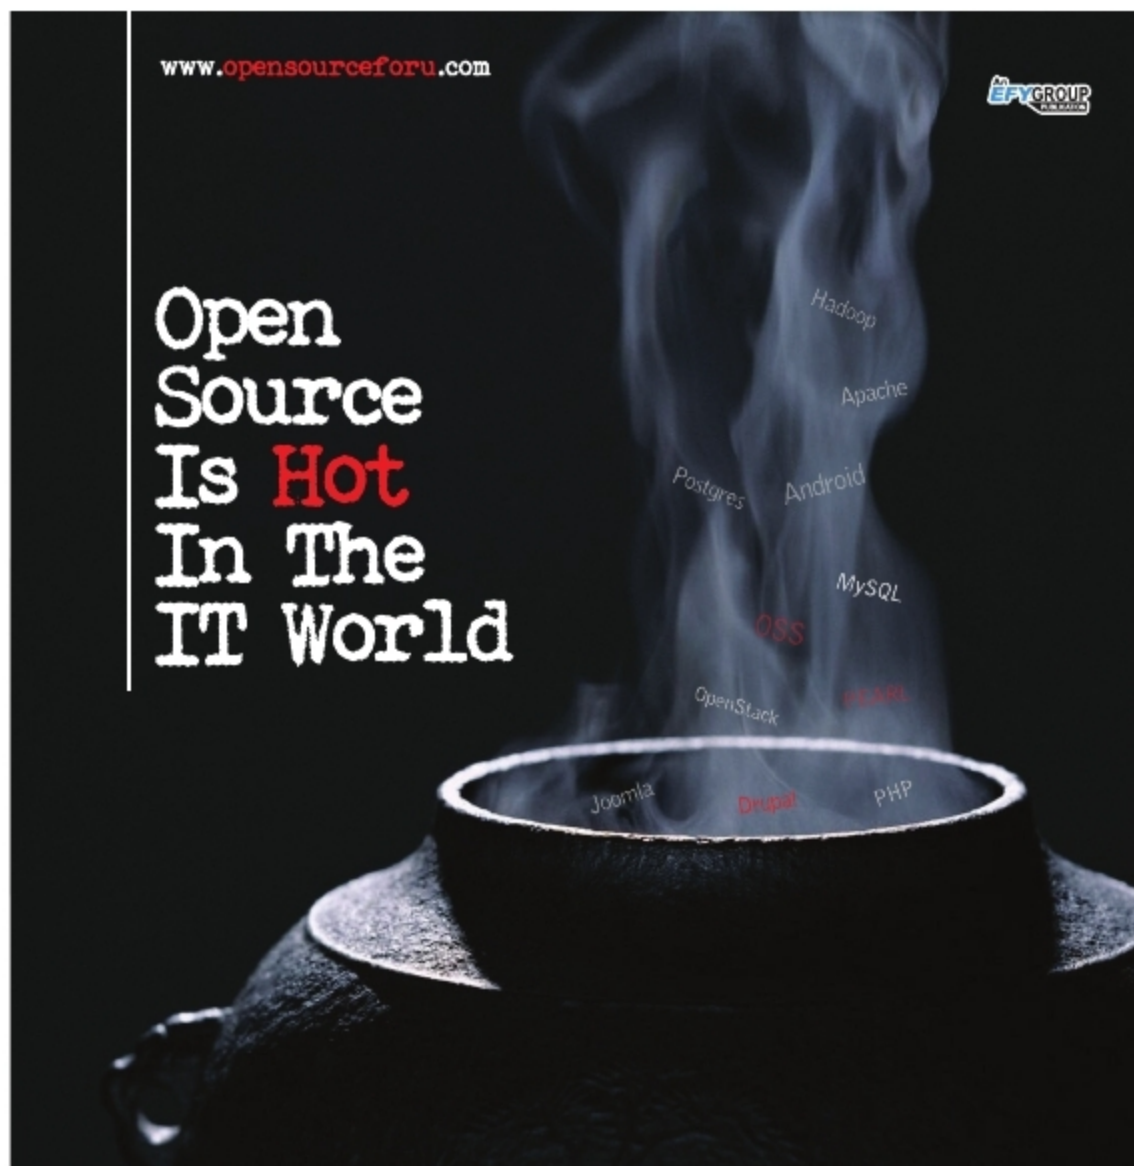

Create a table

Open an SQL editor (*Alt + E*). **CREATE TABLE** is the keyword that tells the database system what you want to do. In the parentheses is the list that defines each column in the table and what kind of data it displays. For example:

By: Saurabh Kumar and Surabhi Kumari

Saurabh Kumar is a gold medallist from ITM University, Gwalior. His areas of interest are mathematics, Big Data and business intelligence. He is currently a software developer at an MNC.

Surabhi Kumari is well experienced in the field of IT. She is a quality analyst at a leading IT company. Her areas of interest are software testing with automation, API, and SQL.
