

Deploying a Flask App on Heroku

Heroku is one of the most popular PaaS platforms in the market, specifically targeted towards developers who are about to start their journey in cloud computing. Flask is an open source Web application framework written in Python that is known for its simplicity and ease of deployment. This article is a quick tutorial to help you get started with cloud computing using the best and most easy-to-use technologies.

If you are just getting started with cloud computing and can't wait to deploy your first app with as little jargon as possible, then this article is a good place to start. There are many benefits of using Flask with Heroku, but the primary benefit is the speed with which you can deploy your projects on the cloud.

Why use Heroku for deployment

Heroku is a Platform as a Service (PaaS) provider, which is ideal for developers who are just getting started with cloud computing. It offers a basic package that is free for cloud enthusiasts who just want to poke

around a bit with the platform. It takes care of most of the installation jargon for you, and you can get your app up and running in no time. The major benefits of using Heroku are:

- It is user-friendly
- There is no infrastructure needed
- It supports multiple languages and frameworks
- It offers a good analytics and reports module
- It uses the Git version control system by default

Why use the Flask Web application framework

When it comes to Python based Web

development frameworks, you might be tempted to go with something standardised such as Django. But if it's the speed of deployment that is your major concern, as is the case in this article, then Flask should be your go-to framework.

The major benefits of using Flask are:

- Extremely flexible
- Simple to use
- Small core and easily extensible
- Fast in deployment
- Built-in encryption for user sessions
