

GitHub launches advanced version of code review for mobile

GitHub for mobile lets you get a lot done without having to sit at your desk. Those who use the app to review code have been doing so taking a walk or sipping coffee on their balcony. And a lot of these people aren't just triaging notifications in the app – they're reviewing and merging code. Since its launch, there have been almost 700,000 reviews and over 350,000 merges, which is a lot of code to ship while you're on the go. There has been a lot of feedback too about the ways to improve the code review experience in GitHub for mobile.

So the newest version is shipping a bunch of features that make code review easier, faster and more productive.

The new version of GitHub for mobile features an overhaul of the code review experience. For example, it can be super painful to read code on your mobile device when the lines keep wrapping. In fact, the ability to turn off the line wrapping is the top feature request from the community. So a toggle has been added for that!

Sometimes, you need a little more control over how your commit appears to your team. So now, you can also change the email associated with a merge and edit the commit description.

Last year, support for comments on multiple lines of code in GitHub's Web interface had been announced. This is helpful when you need to explain how your suggestion fits into a broader context. Now you can do the same thing in GitHub for mobile. Just long press to enter multi-select mode.

And if you're dealing with larger reviews that span multiple files? Tapping the new 'Jump To' icon lets you quickly bounce between them so you can review everything in a snap.

increasingly important source of differentiation. This Linux System expansion enables OIN to keep pace with open source innovation, promoting patent non-aggression in the core. As open source grows, we will continue the measured expansion of the Linux System and, at the same time, recruit more companies into the OIN community to further mitigate patent risk associated with the use of core open source code."

In the current Linux System definition update, OIN's expanding licensee community will benefit from patent risk mitigation associated with the use of core software packages drawn from Hyperledger, Apache Avro, Kafka, Spark, Hadoop, Automotive Grade Linux (AGL), Robot Operating System (ROS), KDE Frameworks, Android AOSP 10, Eclipse Paho, and Mosquito among others. OIN also said that it is incorporating the Linux implementations of exFAT into the scope of patent non-aggression by virtue of this update. In total, the expansion includes 520 new software components. This brings the total number of Linux System-protected packages to 3,393.

Snyk and PerimeterX team up to address open source vulnerabilities in Web applications

PerimeterX and developer-first security company Snyk have announced a technology alliance partnership that solves the growing number of open source

vulnerabilities found in Web applications. They said that this will help businesses minimise exposure to risk and data breaches.

Ido Safruti, co-founder and chief technology officer, PerimeterX, said, "By partnering with the

industry leading vendor for open source vulnerabilities, PerimeterX is ensuring that our customers have access to the most accurate and timely information to mitigate Web application vulnerabilities in real time. The PerimeterX Code Defender runtime behavioural analysis and mitigation across first-, third- and Nth-party scripts, combined with comprehensive and actionable JavaScript vulnerability data from Snyk, provide users a quick path to remediation."

The need for efficiency and speed in developing Web applications is driving the increasing adoption of open source and containers. In attempting to expedite development by leveraging open source, code reuse, and third-party scripts, enterprises face the bigger potential for risk.

The Snyk 2020 State of Open Source Security Report found that the bulk of the open source vulnerabilities discovered are considered to be of high severity. As per PerimeterX, around 70 per cent of typical website code comprises third-party scripts.

ScyllaDB hires Randall Jackson as chief revenue officer

ScyllaDB has announced that Randall Jackson has joined as its first chief revenue officer. Jackson will guide top-line revenue growth across all pricing and deployment models. This includes partnership and channel sales, subscription-based enterprise, and database-as-a-service offerings.

ScyllaDB CEO Dor Laor said, "ScyllaDB is growing quickly on all fronts. We're expanding our core business, forging new partnerships, and transforming Scylla to support more and more use cases. Randall's experience
