

Figure 2: Benefits of AWS blockchain templates

Choice of platform services: Since the AWS blockchain template provides different flavours of blockchain services like Hyperledger Fabric and Ethereum, you can get an ‘out of the box’ choice of different blockchain frameworks quite easily.

Cost-efficient: Due to the flexibility of the ‘pay as you go’ service, the AWS blockchain is highly cost-efficient.

Associated management tools and services: By utilising the power of cloud services, you can use monitoring and management services like AWS CodeDeploy and CloudWatch for a decentralised blockchain application, giving the flexibility to integrate into native services of the blockchain platform integration.

Popular use cases

There are various use cases that have been made possible with AWS blockchain templates, across different industries, as explained below.

Supply chain: In the manufacturing or retail industry, supply chain management involves a series of activities, including stock monitoring, asset management, order processing, invoice services, and payment services, to name a few. In this series of chain activities, a lot of workflow and approval is required, which generally causes a delay due to various user roles involved (e.g., service provider, approver, and delegator).

With a decentralised blockchain platform created using an AWS blockchain template, all these workflow activities can be made faster in the network, since multiple nodes are involved in open ledger processing.

Financial services: Decentralised payment processing has become very important with more and more digital payments being adopted post COVID-19. Since the transaction in the blockchain platform network is immutable and cannot be tampered with easily as the ledger copies are across all the nodes in the network, it is very safe to use the AWS blockchain template for financial service-related use cases.

IoT: Industrial Internet of Things (IIoT) services involve a lot of secured services, data analytics, and transaction processing. Hence a blockchain platform used in combination with IoT sensors to collect data feeds and use them for enrichment, processing, and storage using a blockchain transaction is quite a popular

use case. It can be built using an AWS blockchain template and IoT services like IoT Core and IoT Greengrass.

Insurance: Distributed Ledger Technology (DLT) adds a powerful feature to insurance use cases like streamlining and reducing wait-time for insurance claim processing, payment management and KYC processing activities.

Healthcare: Blockchain services in healthcare like customer management, booking services (e.g., non-critical surgery, bed services, pick-up services for health check-up), and patient data handling in a decentralised fashion (using AWS blockchain templates) are getting popular. For example, if there is a patient being admitted to a hospital, one can pull complete details about him/her, including previous hospital history, ailments, and treatment history from other hospitals, by getting an identification number like Aadhaar from a decentralised patient database. **END** 🐧
