

“Contributing to OSS is my ‘guru dakshina’ to the open source community”

Divyanshu Verma presently serves as the senior manager in charge of software development at Intel Corporation. He comes with a rich experience of working in leading tech companies like Ericsson, Broadcom, NetApp, Dell, and now Intel. He has a rich experience in AI, ML, cyber security, IoT, smart connected homes, Linux, embedded Linux, device drivers, open source, DevOps, networking, automation, and so on.

In an exclusive chat with **Sreejani Bhattacharyya** of *OSFY*, Verma talks about his professional journey and what it takes to make a career in open source.

Divyanshu Verma, senior manager software development, Intel Corporation

Verma was first introduced to open source way back in 1999 when he accidentally got a Linux distro CD while reading a magazine named ‘Dataquest’. He started browsing it out of curiosity, and was amazed at all the tools and the open source software that was available inside for free. He said, “I was especially curious about operating systems and with Linux in my hand, I got everything I had ever dreamt of, such as kernel source coder, a free C compiler, Vi editor, etc.”

Since then, Verma has been hooked to open source. He says that his interest in open source was handed a boost when he got the entire kernel code on Linux, as he could now understand the fundamentals of how an operating system boots – especially about how a kernel switches from physical memory to a virtual memory system.

Verma feels that these concepts were purely academic for him before he got the Linux CD.

“However, with the open source Linux OS in hand, I got a lifetime opportunity to learn and experiment concepts such as memory management, device drivers, file systems, etc,” he adds. In a career spanning over 20 years, Verma has since worked on kernel development, cloud computing, cyber security, networking and router development, file system development and IoT, among others.
