

Growth of 5G Market and Its Impact on the Economy

The introduction of 5G has benefitted the economy in several ways. It has helped in the growth of various new technologies such as the Internet of Things (IoT), artificial intelligence (AI), virtual reality (VR), augmented reality (AR), machine learning (ML), and blockchain. Apart from leading the growth of new business operations and applications, it has provided revenue platforms for telecom operators.

Technology has been going through an endless revolution for the past couple of years. It has transformed our lives and several industrial sectors in various ways. Telecommunication is one of the major sectors that has benefitted greatly from new technologies. Mobile Internet has played a huge role in uplifting the popularity of smartphones among every age group. It all started from 2G, moving onto 3G and 4G, and now it has entered a new phase, 5G.

The primary objective of 5G is increasing data speed while also reducing the cost of operations in terms of per GB cost. 5G will escort innovative business models, thereby providing state-of-the-art applications to individuals

and scores of sectors such as industrial, commercial, educational, healthcare, agricultural, and social. All these sectors require a faster and uninterrupted network that can be offered by only 5G.

The 5G network furnished with ultra-low latency will also help in the growth of various new and emerging technologies such as the Internet of Things (IoT), artificial intelligence (AI), virtual reality (VR), augmented reality (AR), machine learning (ML), blockchain, and fixed wireless high-speed broadband network. Apart from leading the growth of new business operations and applications, it will also provide revenue platforms for telecom operators.

The countries that have successfully deployed 5G networks are Australia,

South Korea, Taiwan, Japan, the US, UK, Germany, and a few others. They lead in terms of 5G network deployment, and site activations within the Asia Pacific have 5G non-standalone architectures that support 4G/LTE infrastructure for higher speeds.

As of now, India is home to a mere 322 million wireless broadband subscribers. However, as per a report by Edelweiss, the subscribers are expected to jump to one billion by 2025 with 5G. It is crucial as telecom is the very backbone of India's digital revolution.

Potential market areas of 5G communication

As per IDC's carrier transformation survey run at APeJ level, the top three 5G use cases for operator CXOs are massive IoT, remote-controlled automation, and multi-access edge computing. Under the current scenario, a gamut of interconnected products and services (smart homes, smart refrigerators, smart HVAC, smart cars, CCTVs, smart devices, etc) might be an ideal play for operators, but India is still at a very nascent stage for 5G adoption.

Hence, in this context, let's find out what the experts have to say.

Faisal Kawoosa, founder and research analyst at techARC, says, "Due to the ongoing Covid-19 crisis, we have seen how much we can leverage from a robust and fast broadband connection. We believe that we have several use cases like industrial automation, high-speed home broadband, or immersive
