

How to Go About Migrating to the Cloud

Digital transformation has become the new normal after the COVID-19 pandemic, irrespective of whether it is a business-to-business, business-to-customer or business-to-employee solution. Innovation is the need of the hour. Business execution needs innovation to move things forward digitally, and cloud services are a catalyst for this transformation. Here is a primer on how to migrate your organisation's services to the cloud.

By making their services available to enterprises, Cloud Service Providers (CSPs) have brought about a remarkable change in the approach to IT infrastructure needs and solutions. Cloud services are available for all technical needs, ranging from Big Data and IoT, to mobile, analytics and AI/ML. Be it a startup or a large enterprise, CSPs have offerings and services for all.

In this journey of digital transformation, a cloud strategy is an enabler and may be initiated through many queries, such as:

- How to identify the right CSP to meet the technical and business needs of an enterprise?
- Will platform/vendor lock-in be enforced if we go with one CSP?
- Will there be an adequate level of security and compliance enforcement?
- What will be the cost in the short/long-term and the ROI?
- What will be the payback period for costs incurred?
- What are the maintenance and support requirements?
- Will we lose control of the system after migrating to the cloud?
- What are the required skillsets for cloud based solutions and IT infrastructure?
