

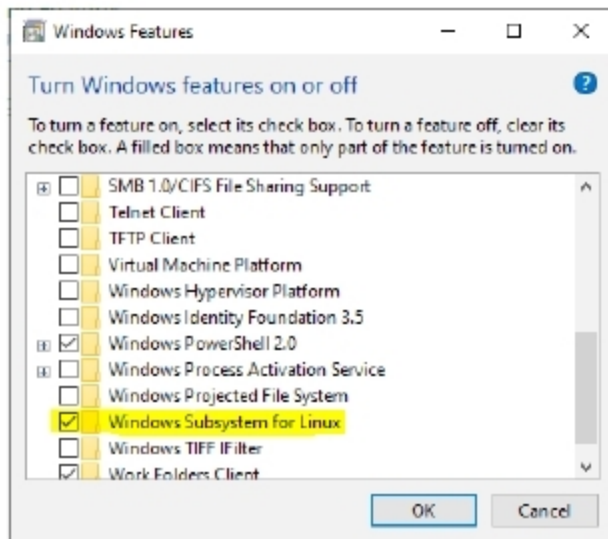

Figure 1: Enable WSL

security features like brute force protection, password handling, rate limiting and much more.

4. ownCloud has a scalability of only up to 20,000 users whereas in the case of Nextcloud this is unlimited.

This is why Nextcloud is a better option than ownCloud. If you've ever thought about creating a DIY personal cloud storage, you are at the right place.

## The 20 easy steps

You can deploy your own Nextcloud server on your Windows machine in 20 easy steps:

1. Enable WSL (Windows sub-system for Linux).  
Go to *Control Panel -> Programs -> Turn Windows features on or off -> Check Windows Subsystem for Linux*
2. Install Ubuntu 18.04 LTS from Microsoft Store, and after installation click on *Launch*.
3. Create your UNIX user name and password.
4. Update the packages using the command:

Figure 2: Update packages

```
sudo apt update && sudo apt upgrade -y
```

5. Install Apache, PHP, MySQL for Nextcloud using the command:

```
sudo apt install apache2 mysql-server php7.2 libapache2-mod-php7.2 php7.2-gd php7.2-json php7.2-mysql php7.2-curl php7.2-mbstring php7.2-intl php-imagick php7.2-xml php7.2-zip php7.2-dom
```

6. Download and install the Nextcloud server.

Go to the official Nextcloud page and get the download link: *Wget https://download.nextcloud.com/server/releases/nextcloud-19.0.1.zip*

7. Extract the Nextcloud server files using the command:

```
sudo apt install unzip nextcloud-19.0.1.zip
```

8. Copy the Nextcloud files to Apache Web directory:

```
sudo mv nextcloud /var/www/html/nextcloud/
```

9. Create a data folder inside the copied folder:

```
sudo mkdir /var/www/html/nextcloud/data
```

10. Set the permissions for Nextcloud directory:

```
sudo chown -R www-data:www-data /var/www/html/nextcloud/
sudo chmod -R 755 /var/www/html/nextcloud/
```

11. Create a new configuration file called *nextcloud.conf*:

```
sudo nano /etc/apache2/sites-available/nextcloud.conf
```

12. Paste the code mentioned below, and save and close using (*ctrl + o* and *ctrl + x*):

```
<VirtualHost *:80>
    DocumentRoot /var/www/html/nextcloud/
    Alias /nextcloud "/var/www/html/nextcloud/"
    <Directory /var/www/html/nextcloud/>
        Options +FollowSymlinks
        AllowOverride All
        Require all granted
        <IfModule mod_dav.c>
            Dav off
        </IfModule>
        SetEnv HOME /var/www/html/nextcloud
        SetEnv HTTP_HOME /var/www/html/nextcloud
    </Directory>

    ErrorLog ${APACHE_LOG_DIR}/error.log
    CustomLog ${APACHE_LOG_DIR}/access.log combined
</VirtualHost>
```

13. Open the *apache2.conf* file and add these lines to the configuration file:

```
d9frost@D9Frost2:~$ wget https://download.nextcloud.com/server/releases/nextcloud-19.0.1.zip
```

Figure 3: Download the Nextcloud server package

```
d9frost@D9Frost2:~$ sudo apt install apache2 mysql-server php7.2 libapache2-mod-php7.2 php7.2-gd php7.2-json php7.2-mysql php7.2-curl php7.2-mbstring php7.2-intl php-imagick php7.2-xml php7.2-zip php7.2-dom
```
