Figure 4: A Web conference in local Moodle

conference to suit your particular needs. But we will only provide the above-mentioned mandatory details to set up a Web conference so that even absolute beginners of Moodle can test the features of the BigBlueButtonBN plugin.

We have added two participants to this Web conference, *Guru* and *Shishya*. We have assigned the role of moderator to *Guru* and the role of a viewer to *Shishya*. Notice that the moderator can use a lot of features provided by the BigBlueButtonBN plugin, like sharing the content of his computer screen, using a virtual whiteboard, etc. The user with the role viewer can also use certain features like using the public chatroom.

With those essential details filled, we can go down the page and click on any one of the two buttons to save the details — ‘Save and return to course’ (which will take you to the course page) or ‘Save and display’ (which will take you to the Web conference link just created). Go to the course page of BBB101 and press the button ‘Turn editing off’. Now you will see a link to the Web conference we have just created, as shown in Figure 3.

The user called *Guru* can now start the Web conference by clicking on this link and pressing the button ‘Join session’. He or she will then be taken to the BigBlueButton Web conferencing application. Users might be asked to test their microphones on entry, and they have the option to mute/unmute their microphones and share/stop their webcams.

But now we have a problem. Remember, we are testing this plugin in our local copy of Moodle and right now there is just one user in the conference. How can we test a Web conference with just one user? Well, BigBlueButton has a test server which allows us to test the plugin even with the local copy of Moodle. Open an incognito window on your browser (incognito window is very essential) and open one more copy of your local Moodle
