

Linux kernel gets rid of 'double ungood' bug

Recently, Linus Torvalds came up with the first release candidate of the latest Linux kernel 5.12. The release, which was meant only for people who are testing the Linux kernel for bugs, turned out to have a bug that could have damaged the file system of the test system. But, fortunately, the bug has been fixed.

This blunder, Torvalds said, started with “a very innocuous code cleanup and simplification that raised no red flags at all, but [it] had a subtle and very nasty bug in it: Swap files stopped working right. And they stopped working in a particularly bad way; the offset of the start of the swap file was lost. Swapping still happened, but it happened to the wrong part of the file system, with the obvious catastrophic end results.”

Or, as Torvalds says, “you can end up with a file system that is essentially overwritten by random swap data. This is what we in the industry call ‘double ungood’.”

Torvalds continued, “It really wasn’t a very obvious bug, and it didn’t even show up in normal testing, exactly because swap files just aren’t normal. So I’m not blaming the developers in question, and it also wasn’t due to the odd timing of the merge window; it was just simply an unusually nasty bug.”

data files and .aup file parted ways. Users quite reasonably expected the .aup file to contain the entire project. The new .aup3 file does contain the data as well. The open source database, SQLite3, is now being used to store everything in one .aup3 file.

Importantly, note that you can open your older .aup projects in Audacity 3.0.0, where they will be converted to the new .aup3 format.

D-Link joins the Open Invention Network community

D-Link has become an Open Invention Network (OIN) community member to protect open source software against patent risks and promote open collaboration and innovation.

D-Link Corporation announced it has become a licensee and community member of OIN, the largest patent non-aggression community. As a global leader in networking and connectivity solutions for consumers, enterprises, and service providers, D-Link recognises the benefits and values of supporting the development of open source software (OSS).

“More than 70 per cent of D-Link’s networking and communication solutions have implemented open source software since the beginning phase of research and development,” explained Mark Chen, president of D-Link. “We have and will continue to advocate for OSS and patent non-aggression, and we look forward to making our contributions to the OIN community to encourage innovation,” he added.

“We are pleased D-Link is employing open source code in its products and welcome its commitment to patent non-aggression in core Linux and adjacent open source technologies required under the OIN licence. The diffusion of a common set of values in terms of patent risk mitigation, coupled with more broad-based adoption of rigorous compliance management processes, creates a context for IP governance that OIN encourages among all its community members,” said Keith Bergelt, CEO of Open Invention Network.
