

Akash MAINNET 2, the first decentralised open source cloud, launched successfully

Akash Network, a project out of Overclock Labs, has confirmed the successful launch of Akash MAINNET 2, which it says is the first open source cloud and the only viable decentralised cloud alternative to centralised cloud providers like Amazon Web Services, Google Cloud and Microsoft Azure.

Akash MAINNET 2 empowers developers to break free from the limitations of traditional cloud infrastructure, and accelerates growth and scale in the blockchain ecosystem by enabling developers and companies to decentralise their cloud infrastructure, deploying applications faster, more efficiently, and at a lower cost.

“With the ongoing pandemic, we’re seeing more of people’s lives and work moving to the cloud. In the US\$ 370+ billion cloud computing market, MAINNET 2 provides a decentralised, faster, more efficient, and lower cost option in the market,” said Greg Osuri, CEO of Akash Network. “Akash MAINNET 2 propels our vision to enable high-growth blockchain companies and developers a viable alternative to centralised cloud services,” he added.

“Having previously worked with product engineering--both open source and proprietary, I’ve experienced first-hand the constraints of centralised cloud services. I’m excited to bring MAINNET 2 to market with a Uniswap-style experience to cloud deployments in a cost-efficient, permissionless, censorship-resistant, and non-custodial way,” said Adam Bozanich, CTO of Akash Network.

Akash Network is a proof-of-stake chain, built on Cosmos Hub, which leverages Akash Token (AKT), a native utility token, to govern and secure the blockchain, and provide a store and exchange of value.

Red Hat announces free RHEL subscriptions for eligible organisations

Red Hat has announced a new, no-cost program especially for the requirements of projects, foundations and more: Red Hat Enterprise Linux (RHEL) for Open Source Infrastructure. Joining a growing set of no-cost and low-cost programs, RHEL for Open Source Infrastructure provides a simpler, clearer and documented process for projects, communities, standards bodies and other not-for-profit software groups engaged with open source to gain access to RHEL subscriptions.

Under the program’s terms, eligible organisations will be granted access to no-cost RHEL subscriptions for any use within the confines of their infrastructure. This includes build systems, continuous integration (CI) testing and general project requirements (i.e., Web servers, mail servers, etc). These subscriptions will be self-supported by default, providing full access to the Red Hat customer portal, knowledge base articles and forums, and also include Red Hat Insights, a proactive analytic tooling.

Neil McGovern, executive director, GNOME Foundation, said, “As a non-profit, we rely on donations to help us achieve our goal of a world where everyone is empowered by technology they can trust. RHEL subscriptions are an essential part in this. With full operating system management and security updates, we can concentrate on the services we provide to GNOME users and developers without having to worry about the underlying systems. Red Hat has generously provided these services to GNOME at zero cost for years, and we look forward to continuing our relationship for a long time to come.”

Complete information on eligibility and how to get the subscription is available in the blog post by Jason Brooks on the Red Hat website.
