

NIC Stands to Gain by Open Sourcing CollabCAD

CollabCAD is a great product for 3D Computer Aided Design (CAD) developed by the National Informatics Centre (NIC). What would it take for it to reach a global audience?

Octopart. This means that for every problem that you are trying to solve there are likely several similar models that you can download and use as is, or modify to suit your needs. The globally popular electronics hobbyist hardware vendors Raspberry Pi and Arduino have also donated to the CERN KiCad initiative.

Farsighted move by NIC to introduce CollabCAD to schools

CollabCAD 3D modelling software is an initiative of the National Informatics Centre (NIC, Department of Information Technology), Bhabha Atomic Research Centre (BARC) and Vikram Sarabhai Space Centre (VSSC). NIC has been

Printed circuit boards (PCBs) are the heart of any electronic device, ranging from toasters to smartphones. In 2015, CERN, the European Organisation for Nuclear Research, was looking for a software that would make it easier for electronics engineers to share their PCB designs.

It chose KiCad, which is free and open source software (FOSS), and assigned its own experts to turn it into an efficient tool for designing open source hardware. Five years later, the results are spectacular. As of June 2020, over 850,000 free KiCad models could be downloaded on the search engine for electronic and industrial parts, called
