

Hotels maintain their principle of 'Responsible Luxury' by using a suite of independent assessment services that reassures visitors that the management has put prevention and safety at the core of their risk management strategy.

SITA World Tours recently bagged the 2020 Asia-Pacific Automation Growth Innovation & Leadership Excellence Frost Radar Award, bestowed by Frost & Sullivan. SITA has allied with the key airline industry partners that work for a common goal to digitally track, trace, and record the movements and maintenance of aircraft parts. This is completed by using a maintenance, repair, and overhaul (MRO) blockchain. Members of the MRO Blockchain Alliance include Bollore Logistics, Cathay Pacific, FLYdocs, HAECO Group, Ramco Systems, SITA, and Willis Lease Finance Corporation, supported by Clyde & Co.

The recording and tracking have two separate strands of information for each aircraft part. The first is a digital thread that provides real-time status, chain of custody, and back-to-birth track and trace of the part. The second is a digital passport (like a human passport) that provides an obvious identity of an aircraft part and checks certification of airworthiness to attest the tenure. The use of an MRO blockchain can simplify, secure, and speed up tracking the aircraft parts.

Uber Travel, tussling a large role in the travel and hospitality sector, is using a decentralised blockchain architecture based on the advanced Chandra-Toueg algorithm. Uber faced difficulties like high fees (to be paid to mediators), lack of transparency and security with the centralised approach, hence switched to the decentralised way of connecting drivers and riders with each other via an instant P2P protocol without the need for intermediators.

Blockchain is proving its potential and changing the travel industry's status quo by playing a major role in keeping the network secure, protected, and trusted. In India, more and more travel and tourism companies as well as start-ups are expected to be on-board as blockchain expands the scope of further digitisation and provides solutions for many tenacious complications

that hold back the growth of an organisation.

Financial services are facing challenges in verifying and identifying customers for financial crime and money laundering; the traceability and immutability of blockchain's distributed ledger technology offer a perfect solution. The built-in efficiency and security of blockchain can trigger huge innovation in travel, paving the way for new business models and collaboration. This will reshape the travel and tourism industry by eliminating siloed and inefficient centralised systems. Hundreds of blockchain developers are working in India. So many more companies are likely to make use of these blockchain developers and increase transparency, security, and efficiency of the tourism and hospitality industry. **END** 🐧
