

What is DevOps and Why Should You Care?

We've been hearing about DevOps for quite a while. In this article, we look at what the hype is all about.

The term DevOps is an abbreviation for development (Dev) and operations (Ops). Under it, people, processes and technologies come together to constantly provide benefits to customers.

What does DevOps mean for employees? It allows people working in disparate departments — development, IT operations, quality assurance and security — to coordinate their actions and jointly create better and more reliable products. By implementing

the DevOps culture, along with the appropriate techniques and tools, teams are able to better respond to customer needs, increase confidence in the applications they create, and achieve business goals faster.

Teams that apply the DevOps culture, methods and tools become highly efficient, create better products faster and increase customer satisfaction. Optimising collaboration and increasing productivity is also a prerequisite for achieving such business goals as:

- Adapting to market conditions and a competitive environment
 - Maintaining system stability and reliability
 - Quick entry to the market
 - Reducing the average recovery time
- DevOps affects the application life cycle at all stages — from planning and development to delivery and operation. Each stage depends on the others, but the stages themselves do not depend on the roles performed by the company's employees. In a fully implemented DevOps culture, everyone has a role to play at almost each stage.
