

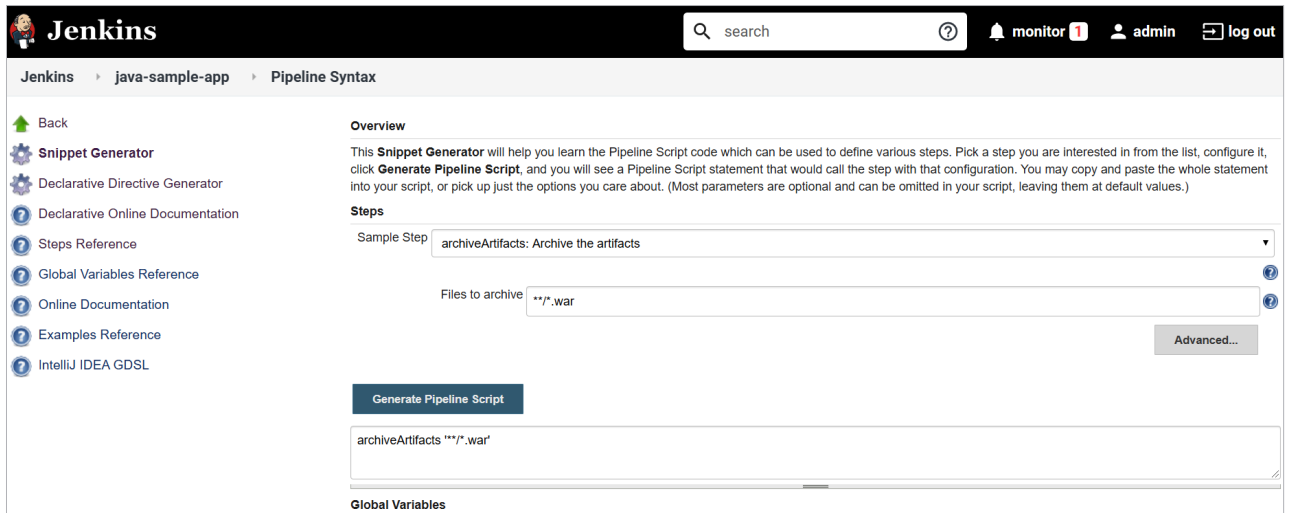

Figure 3: Pipeline syntax -- snippet generator

There are two types of pipelines in Jenkins as of today. This means that *Jenkinsfile* can contain two different types of style/syntax.

Scripted pipelines

Scripted pipelines follow the imperative programming model. These pipelines are written in Groovy script in Jenkins. They require Groovy programming skills and hence are not easy to learn for a non-programmer. They are not easy to understand, manage and maintain. The structure of the scripted pipeline is as follows:

```
node {
    /* Stages and Steps */
}
```

```
node {
    stage('SCA') {
        // steps
    }
    stage('CI') {
        // steps
    }
    stage('CD') {
        // steps
    }
}
```

A snippet generator can be employed to create script commands to use in the pipeline.

Similarly, the declarative directive generator section is used to create a script in declarative syntax.

Declarative pipelines

Declarative pipelines follow a declarative programming model. These pipelines are written in the domain-specific language in Jenkins, which is easy to understand. The following is a sample declarative pipeline:

```
pipeline {
    /* Stages and Steps */
}
pipeline {
    agent any
    stages {
```

```
stage('SCA') {
    steps {
        //
    }
}
stage('CI') {
    steps {
        //
    }
}
stage('CD') {
    steps {
        //
    }
}
```
