

What Does the Future Hold for DevOps?

DevOps has become one of the fundamental principles based on which most (if not all) software is being built today. In this article, we shall take a deeper look at DevOps, how it's being used in the software industry, its intrinsic dependence on open source software, and what the future holds for it.

DevOps is everywhere. Literally. If you are working in a tech company as a developer or are anything closely related to being a developer, you have to deal with DevOps. Even if you are not in any way a coder, but have to collaborate with developers, as is the case with most of the operations related roles, then DevOps is an essential part of your job.

Now, before continuing any further, I urge you to take a pause and in your own words, try to define DevOps in a sentence or two. After this little exercise, continue reading the next section to understand the reason why I asked you this question.

Defining DevOps

If you faced difficulty with the aforementioned exercise, then you are a part of the majority. Why is it so hard (though not for the lack of trying) to comprehensively define DevOps? The reason is that there is no standard way of defining it. DevOps is like a social norm, a shared value amongst people from different departments in an IT company. We realise its importance and regularly put it into practice, but none of us are able to put it in words in a manner that fits all criteria.

Another reason why it's hard to define is simply because DevOps means different things to different people depending upon their role in
