One of the important aspects of making an application successful is to deliver it with an effective and intuitive user interface. Many of the modern data-heavy apps face the challenge of building an effective user interface quickly, without taking complicated steps. Streamlit is a promising open source Python library, which enables developers to build attractive user interfaces in no time. This article introduces various components of Streamlit that will enable you to migrate your plain scripts into readily usable Web apps in a jiffy.

to spend a lot of time on building this user interface. Rather, they are generally more interested in fine-tuning the core model and making it optimal. This is the exact pain point that Streamlit addresses.

Streamlit is a free and open source software library based on Python to build user interfaces. It enables developers to turn their data scripts into Web apps in minutes. As it is entirely written in Python, you don't need to be a UI master to build these Web apps. It is really not an exaggeration that the user interfaces can be made in minutes with Streamlit.

This article introduces you to the world of Streamlit and its powerful components are explained with the help of code snippets. Streamlit has the following advantages.

- **Python all the way:** The Streamlit apps are built entirely with Python. You can build an app with just a few lines of code. When you update the code, you will see that the app gets updated with a simple notification.
- **Interactions made simple:** Adding widgets into a Streamlit app is similar to declaring a variable. It doesn't require building specific bindings, etc.
- **Instant deployment:** The Streamlit sharing platform can be used to effortlessly share and collaborate.
- **Recognition:** Streamlit is used by many leading data science groups, which proves its potential.

Data science projects adopt various approaches, including machine learning, to build the core model. However, when these models are delivered to the actual users, there is a pressing need to build an easy-to-use, intuitive user interface.

Many-a-time machine learning projects are built in environments such as Jupyter or as standalone Python scripts. But these scripts cannot be handed over to the end users as they are, and need a friendlier user interface. However, the machine learning teams may not be able
