

Mavenir and Red Hat team up to transform mobile network infrastructures

Mavenir has announced a strategic collaboration with Red Hat to certify Mavenir applications for mobile networks with Red Hat OpenShift Container Platform, creating solutions and platforms to transform the mobile infrastructure towards the new future of containers and 5G. The intent is to develop common solution blueprints for transformation to 5G for Mavenir's 5G Core, vRAN and IMS workloads.

Pardeep Kohli, president and CEO of Mavenir, said, "We are proud to work with a leading company like Red Hat to certify our workloads and to continue to demonstrate the capabilities of Mavenir cloud-native software. We are looking forward to collaborating and demonstrating our agility together to deliver high-quality software for our customers, boosting the 5G cloud-native ecosystem."

Mavenir and Red Hat believe that the future of mobile communications is built on the open hybrid cloud, Linux containers and cloud-native microservices. This will give both communications service providers and enterprises the ability to implement a variety of 5G services, like network slicing and edge computing, in an agile and automated way.

Paul Cormier, president and CEO, Red Hat, said, "Modern networks that deliver the agility and flexibility customers require are rooted in open source technologies, including Kubernetes and containers. This is where Red Hat is an industry leader, and we are pleased to collaborate with Mavenir to certify its workload and deliver solutions that ease deployment on mobile networks. Red Hat OpenShift can help the telecommunications industry deliver 5G services, such as massive machine-type communications and ultra-reliable low latency communications with greater agility and automation, across public, private or hybrid clouds."

OpenSSF adds new members to advance open source security education

OpenSSF, a cross-industry collaboration to secure the open source ecosystem, has announced new membership commitments to advance open source security education and best practices. The new members include Citi, Comcast, DevSamurai, Hewlett Packard Enterprise (HPE), Mirantis and Snyk.

Kay Williams, governing board chair, OpenSSF, and supply chain security lead, Azure office of the CTO, Microsoft, said, "Open source software is embedded in the world's technology infrastructure and warrants our dedication to ensuring its security. We welcome the latest OpenSSF new members and applaud their commitment to advancing supply chain security for open source software and its technology and business ecosystem."

Because of its development process, open source has a chain of contributors and dependencies before it ultimately reaches its end users. It is important that those responsible for their users' or organisation's security are able to understand and verify the security of this dependency supply chain.

The OpenSSF is a cross-industry collaboration that brings together technology leaders to improve the security of OSS. Its working groups include Securing Critical Projects, Security Tooling, Identifying Security Threats, Vulnerability Disclosures, Digital Identity Attestation, and Best Practices. OpenSSF has more than 35 members and associate members contributing to working groups, technical initiatives and the governing board, and helping to advance open source security best practices.
