

With companies of all kinds accelerating their digital transformation initiatives, technologies that help them accelerate, like YugabyteDB, are in high demand. This new round of funding will position Yugabyte to meet this increased enterprise demand and power our global expansion into key markets.”

With the new infusion of capital, Yugabyte is building its engineering, DevOps and support staff in India, Russia and Canada. It recently acquired India-based Falarica.io to accelerate its development and recruiting efforts in the APAC region. It is also expanding its sales teams in EMEA and APAC because of strong demand for its open source distributed SQL database, and related products and services.

The funding will also be used to further accelerate enterprise adoption of Yugabyte’s commercial products. Yugabyte Platform, a self-managed private database-as-a-service offering available on any public, private, or hybrid cloud or Kubernetes infrastructure, and Yugabyte Cloud, a fully-managed database service currently available on AWS and Google Cloud, have seen broad adoption in the past 12 months, as per the company. Yugabyte also recently announced YugabyteDB 2.4, a major update including hardened enterprise-grade security features, enhanced multi-region deployment capabilities and significant performance improvements.

There was greater open source activity in 2020: DigitalOcean Survey

While overall participation in open source was down in 2020, 63 per cent of those who actively participated reported an increase in their activity as per a DigitalOcean Survey. According to the respondents, the increase can be attributed to three factors. Twenty-nine per cent of the respondents had ‘more free time’, 28 per cent wanted to ‘use the time to learn’, and 15 per cent were ‘adamant about contributing to a cause they cared about’.

Of the more than 9,500 developers surveyed, the report focused on the 4,440 responses of those who actively participated in open source throughout 2020. The survey revealed the role that open source played in the lives of its members in what was a year unlike any other, and explored whether the core tenets of open source – ‘free’ and ‘open’ – still hold today.

Raman Sharma, VP product and programs marketing, DigitalOcean, said, “There’s no denying that technology played a major role in 2020. However, what we found most inspiring was how the individuals and community behind the code rose to the occasion. Our survey showed that developers dug deeper into the open source community, participating more actively and

Google and the Linux Foundation to fund Linux kernel developers

Open Source Security Foundation (OpenSSF) and the Laboratory for Innovation Science at Harvard (LISH) have published an open source contributor survey report that focuses on the requirement for additional work on security in open source software, which includes the massively pervasive Linux operating system.

Google and the Linux Foundation have announced that they are prioritising funds to underwrite two full-time maintainers for Linux kernel security development, Gustavo Silva and Nathan Chancellor.

Silva and Chancellor’s exclusive focus is to maintain and improve kernel security and associated initiatives to ensure that the world’s most pervasive open source software project is sustainable for decades to come.

“At Google, security is always top of mind and we understand the critical role it plays to the sustainability of open source software,” said Dan Lorenc, staff software engineer, Google. “We’re honoured to support the efforts of both Gustavo Silva and Nathan Chancellor as they work to enhance the security of the Linux kernel,” he added.

Chancellor is a Linux maintainer and has been working on the Linux kernel for four-and-a-half years. Two years ago, Chancellor started contributing to mainline Linux under the ClangBuiltLinux project, which is a collaborative effort to get the Linux kernel building with Clang and LLVM compiler tools.

“I hope that more and more people will start to use the LLVM compiler infrastructure project and contribute fixes to it and the kernel – it will go a long way towards improving Linux security for everyone,” said Chancellor.
