Robots can work tirelessly in adverse conditions. Robotics and simulation are key elements in advanced manufacturing. Hazardous tasks can be simulated before actual implementation, thus avoiding injuries and loss of human life. Well-designed simulations for robotic applications are today being deployed for industrial and scientific use in real world scenarios such as the study of volcanoes, in space centres, for underwater exploration, in military operations, and so on.

Robotic platforms provide the software, databases and conventions that can be used to meet the challenge of developing complex robot actions across a wide range of real-time industrial situations.

Scientists can use a number of free and open source robotic platforms and simulation libraries to automate
