

Top 10 Open Source Tools for DevOps

Every now and then, it is time to take an inventory of the tools that developers use in software development. DevOps as a culture has come to stay. This article looks at the top ten tools being used for DevOps today, as viewed by its author.

DevOps is a culture, and succeeds in an environment that is tools-agnostic. DevOps is about people, processes and tools but not in isolation from either of these. All tools provide pretty similar kinds of features and functionalities. It is all up to the organisation and its culture to ensure the tool fits into its requirements. The ten best tools being used for DevOps today (in my view) are briefly described in this article.

Git

Git is a free and open source distributed version control system created by Linus Torvalds in 2005. It facilitates the management of all sizes of projects efficiently and with speed. Though the learning curve is very easy in Git, it can be difficult to put in best practices considering the existing culture of an organisation and the mindset of its employees.

Git characteristics

Open source	Yes
Licence	GNU General Public License Version 2
Type	Distributed version control system
Written in language(s)	C, Shell, Perl, Tcl, Python
Operating system supported	POSIX (Linux, macOS, Solaris, AIX), Windows
Stable release	2.30.0
Website	https://git-scm.com/
Companies and projects that use Git	Google, Facebook, Microsoft, Twitter, LinkedIn, Netflix, PostgreSQL, Eclipse
