

A few important Docker commands

Description	Command
Log in to the registry	<code>docker login</code>
To build an image from the Docker file	<code>docker build -t sampleapp :1.0</code>
List all the images	<code>docker images</code>
Delete an image	<code>docker rmi imagename</code>
Create a container	<code>docker run --name containerName dockerImage</code>
Pull an image from the registry	<code>docker pull imageName</code>
Push an image	<code>docker push imagename:tag</code>
Clean an unused image	<code>docker image prune</code>

Docker creates, deploys and manages containers on a different host operating system using such resource isolation features as cgroups and Linux kernels.

Kubernetes

Kubernetes or k8s is an open source, extensible and portable container orchestration platform. It offers declarative configurations and automation for deployment.

Kubernetes characteristics

Open source	Yes
Licence	Apache License 2.0
Type	Container orchestration and management
Written in language(s)	Go
Operating system supported	Linux
Stable release	1.20
Website	https://kubernetes.io/
Companies and projects that use Kubernetes	Adidas, Booking.com, Box, Bose, IBM, Nokia, Pearson, Wink, WikiMedia, AppDirect, Spotify

Kubernetes dashboard - Cluster Overview

Nodes

Name	Labels	Ready	CPU requests (cores)	CPU limits (cores)
✓ ip-10-0-2-229.eu-west-2.compute.internal	beta.kubernetes.io/arch: amd64 beta.kubernetes.io/instance-type: t2.small Show all	True	0.00m (0.00%)	0.00m (0.00%)
✓ ip-10-0-3-31.eu-west-2.compute.internal	beta.kubernetes.io/arch: amd64 beta.kubernetes.io/instance-type: t2.small Show all	True	0.00m (0.00%)	0.00m (0.00%)
