

Top 10 Apps for Your Business that are Built on Android Enterprise

Business processes can be automated and improved using sophisticated IT infrastructure, but for that we need state-of-the-art operating systems and apps. Android Enterprise is a Google-led initiative that promotes the use of Android devices and apps in the workplace. The program offers APIs and other tools for developers to integrate support for Android into their enterprise mobility management (EMM) solutions. This article discusses the top 10 apps for businesses that are built on to Android Enterprise.

Android Enterprise, a Google initiative, offers enterprise mobility management (EMM) technology, which is required for processing the business data of an enterprise safely. EMM tools can be used to manage and secure connected mobile devices and mobile computing solutions. They can help to manage an organisation's Bring Your Own Device (BYOD) policy, which allows its employees to use their personal mobile devices to access the company's network and data.

Three main technologies of EMM

EMM is used by Android Enterprise to secure and manage enterprise data using various tools and the API. It uses the following technologies to make any mobile device access the database of an enterprise safely.

1. **Mobile Device Management (MDM):** This enables IT administrators to apply security policies on mobile

devices used within their network, and it gives life cycle management functions like locking, data wiping and control of these devices.

2. **Mobile App Management (MAM):** This also offers security administration and life cycle management functions but these are for the applications running on the mobile devices. With the help of MAM administrators, one can manage and distribute apps among the mobile devices connected to the network.
3. **Mobile Identity Management (MIM):** With this technology, administrators can secure system access. MIM ensures that only authorised users and devices can access protected data. It can help compile various types of identity management processes including digital certifications, single sign-on, device enrolment and authentication.
