

Together, these technologies provide the tools necessary to protect corporate data and prevent any kind of system breach. They also help to manage and control mobile devices remotely, including the OS and the apps installed. This helps employees to use their personal mobile devices under the BYOD policy and also work from home during any crisis. EMM also helps to lock any mobile device remotely, and can be used to track devices that are stolen or lost. With this technology, an IT administrator can even wipe off all the sensitive data from any mobile device whenever required. Its data separation feature gives access to only authorised apps and users, and keeps the personal data and apps of users separately in the system.

Components of Android Enterprise

EMM is integrated with Android Enterprise using three components: EMM console, Android Device Policy and Managed Google Play. The EMM console is the Web interface that can be used by the administrator for managing apps and applying policies to the mobile devices. Android Device Policy is an app that must be installed in the mobile device for the EMM policies to be enabled in it. Managed Google Play is a customised version of the Google Play store that allows only permitted apps to the connected mobile devices.

Top 10 business apps that are built on Android Enterprise

In order to make a business process safe and secure, one must use a reliable business app and be able to manage it with the tap of a finger. As there are many apps available in

the app store, it's often very difficult to find the right one for your business. Capterra Inc. is one company that helps in finding the right app for your business. The company assists customers with selecting the right app for their needs. It also reviews all kinds of apps, and rates them according to their performance and features. The following top 10 list of apps may be helpful for your business and are listed as per the reviews and ratings done by Capterra.
