

4 Ansible

This open source IT engine automates application operation and cloud provisioning. It was created in 2012 by AnsibleWorks, and is now owned by Red Hat. Ansible is developed in Python, is lightweight and has fast deployment. As Python is used to build most Linux and UNIX systems, getting Ansible up and running is very quick, and its agentless feature makes it easy to be set up and used. It can also be run from CLI commands without using configuration files such as reboot. For comparatively difficult tasks, its configuration is handled by the YAML syntax in the configuration file known as 'playbook'. Ansible commands can be written in any programming language and sent over in JSON format. It has also recently started supporting Windows.

5 Kubernetes

This powerful open source system was initially developed by Google for managing containerised applications in a cluster environment. Kubernetes was launched in 2014 after more than a decade of experience of running production workloads at Google with Google's internal container cluster managers Borg and Omega. It aims to provide better ways of managing related and distributed components and services across varied infrastructures. Kubernetes has now become the *de facto* standard for deploying containerised applications at scale in private, public and hybrid cloud environments. The largest public cloud platforms — including AWS, Google Cloud, Azure, IBM Cloud and Oracle Cloud — now provide managed services for Kubernetes.

6 React Native

React Native is a JavaScript framework that is used in many social media platforms, including Facebook, Twitter, and so on. This framework allows the user to build native applications using JavaScript. It brings React's declarative user interface build to mobile platforms as well as allows the developer to use native UI controls to gain full access to the platforms. React Native has a lively GitHub community with several contributors and over 90,000 stars. This platform offers declarative views that permit codes to be read, understood and modified more easily.

It also makes it simple to build component based complex UIs, and allows any local changes to replicate quickly on the project. Developers use the GitHub community to interact, collaborate, and contribute to the program, making it a popular choice for JavaScript coders.

7 TensorFlow

This is a popular open source machine learning (ML) platform. It contains a large number of useful libraries, tools, and community resources focused on making ML capabilities available for developers looking to use them in their projects.

With TensorFlow, developers can easily create and deploy ML models as part of their application and also use them on their system, on the cloud or from a mobile platform.

Developed by experts working in the Google Brain team, the system is compatible with all major operating systems. This GitHub page has more than 150,000 stars and millions of active contributors. It is one of the biggest repositories on GitHub, used by developers worldwide for their projects.

8 DefinitelyTyped

This is a library of TypeScript type definitions maintained on GitHub. In this open source repository, developers can share and keep TypeScript type definitions for JS libraries. It mainly serves as a translator for JS developers to work with TypeScript. Using DefinitelyTyped and its declaration statements, they can discover TypeScript equivalents for existing JS libraries.

Developers can contribute to the repository by adding definitions, testing, making pull requests, and so on. This is an extremely popular page, with thousands of contributors and many times more users, as it directly helps developers with their work.

9 Azure Docs

This is a cloud computing service developed by Microsoft. Basically, it offers services that can be used for building, testing, deploying, and hosting applications. It has a wide variety of top-of-the-line features essential for cloud computing services, including data analytics, DevOps, and many others. Developers can use Azure to handle data and open source their products.

The GitHub repository of Microsoft Azure is devoted to its open source documentation. The page calls developers to contribute to the project by giving feedbacks, reporting issues, and similar helpful ways. The page has more than 7000 contributors and is one of the most active repositories on the platform.

10 Home Assistant

This open source home automation software is intended to be the central system for controlling smart homes. Home Assistant core application software is written in Python and its main aim is local control and privacy. **END** 🐧
