

Ten Applications for Daily Use on Your Linux Desktop

If you use Linux as your primary operating system or are new to Linux, this article is for you. And it's also for those who believe in the myth that Linux does not have all the facilities that Windows has. Applications in Linux are equally good and in some cases even better than those in Windows.

Here are the top 10 applications that you can use on your Linux desktop. So, let's start!

1 VLC media player

Videos are an important source of information as well as entertainment in today's world. Video players are tools for watching videos. There is a range of videos that we watch on a daily basis, like educational videos, movies etc. Therefore, having a good video player is useful and important, and having a free one is even better. VLC media player is one such application. It is an open source, free and easy to use video player. It supports a lot of video formats and is really amazing. You can install

it by using the following commands:

```
sudo apt install snapd
sudo snap install vlc
```

2 Openshot video editor

Video editors are really useful not just for fun, but also to make videos for professional presentations, college assignments, etc. Most online video editing tools have to be paid for and only give trial versions for free. So, having free video editing software on your desktop comes very handy. Openshot is one such free and open source video editor that is also pretty easy to use. You can install it on your machine
