

using the following simple commands:

```
sudo add-apt-repository ppa:opnsight.developers/ppa
sudo apt-get update
sudo apt-get install opnsight-qt
```

3 SimpleScreenRecorder

Screen recorders are important tools and there are very few free and good ones.

SimpleScreenRecorder is a free and open source screen recorder that has many features. For example, it can record computer audio as well as audio from the microphone, based on the option that one chooses. You can use the command given below to install it:

```
sudo apt-get install simplescreenrecorder
```

4 Surfshark VPN

In today's world, when there is so much happening in the cyber world, a sense of privacy is very important. A VPN or virtual private network is something that gives us privacy and helps us hide our identity in the online world. It masks the user's IP and makes the system virtually untraceable. Surfshark VPN is open source, free of cost, and can be installed by using the following command:

```
sudo apt-get install surfshark-vpn
```

5 Virtual Box

Virtualisation software and tools, used by both developers and students, provide good backup. Even if a virtual machine crashes, there is no problem as it is stored just as a file and it's easy to retrieve the data or even create a new machine. Virtual Box by Oracle is a popular, free and open source virtualisation software. A feature-rich product, it can be installed by using a simple command:

```
sudo apt-get install virtualbox
```

6 Visual Studio Code

Good code editors are very useful and important for developers. They make writing code really easy by providing suggestions, plugins, etc. One of the best among them is Visual Studio Code developed by Microsoft, and is really easy and fun to use. It can be installed by using the following command:

```
sudo apt install code
```

7 Mailspring

In today's world, when email has become very important and checking our mails at regular intervals is almost imperative, having a desktop application for the same can be very handy and of great help. Mailspring is one such application. It is free and open source, apart from being extremely easy to use. It can be installed by using the following command:

```
sudo snap install mailspring
```

8 Evince

A PDF reader is another important desktop application. It is an application almost all of us require on our machines. Evince is one such PDF reader that is free and open source. It has many useful features and is really easy to use. It can be installed by using the following command:

```
sudo apt-get install -y evince
```

9 Clam AntiVirus

Antivirus software is software that is used to detect, remove or prevent malware. Clam AntiVirus is one such antivirus software. Though Linux systems are less prone to viruses, this software can block viruses and files that have malware. It can be installed by using the following command:

```
sudo apt-get install clamav clamav-daemon
```

10 Shutter

Screenshots are things that we require often, and one free and open source software for taking screenshots is Shutter. It is very easy to use and can be installed by using the following command:

```
sudo apt-get install shutter
```

There are so many other applications that are open source and really good, but these are the top ten tools that everyone requires on a regular basis and have really good features as well. Hope you try these out, like them and get more involved with open source and Linux!
