

Red Kubes open sources the Otomi Container Platform

Image Source: rawpixel.com

Red Kubes, provider of a turnkey, out-of-the-box Kubernetes based container platform solution, has announced the open sourcing of the Otomi Container Platform community edition. It has also announced a US\$ 1.45 million seed funding from venture capital firm Capital Mills.

While containerisation is happening fast, the technologies to support it are still in their infancy. Kubernetes is the clear leader for doing this work but remains, at this phase, far too complex for the IT masses to use. DevOps professionals and IT departments all over the world are struggling with home-grown solutions or high-priced consultants who build custom platforms that are both expensive and hard to manage.

Sander Rodenhuis, founder and CEO of Red Kubes, said, “We see companies spending a lot of time on Kubernetes and struggling with reinventing the wheel all by themselves. We’re laying down the tracks to guide users through the Kubernetes wild-west with a production-grade integrated solution to guarantee predictability, fast time to market and secure operations.”

The Otomi Container Platform was created with the 12-factor app methodology to design a Kubernetes based container management platform. It uses existing open source projects while being open and flexible. Otomi is extensible and can be easily installed on top of Kubernetes clusters in AWS, Azure, GCP, or even on-premise.

Its features include an OSX like interface, single sign-on, and multi-tenant onboarding.

Red Hat to acquire security company StackRox

Red Hat, Inc. has announced its intent to acquire StackRox. It said that by bringing StackRox’s powerful Kubernetes-native security capabilities to Red Hat OpenShift, Red Hat aims to deliver a single, holistic platform that enables users to build, deploy and securely run nearly any application across the entirety of the hybrid cloud.

Eclipse Foundation transitions to EU based governance

The Eclipse Foundation has announced the formal establishment of the Eclipse Foundation AISBL, an international non-profit association based in Brussels. The new Belgian entity has been launched with the support of its founding members Bosch, Daimler TSS, IBM, and SAP.

By moving its legal residence from the United States to Europe, the Eclipse Foundation says it has created a global institution that builds on its existing membership base, active developer community, and strong institutional relationships.

Mike Milinkovich, executive director of the Eclipse Foundation, said, “The Eclipse Foundation is already the largest open source software foundation in Europe in terms of staff, projects, developers, and members; so the formalisation of our AISBL makes a great deal of sense for us and the EU. I firmly believe that establishing this new organisation will help to accelerate the drive to digitisation throughout the EU, and provide a new engine for the development of innovative and open technologies across the continent and beyond.”

The Eclipse Foundation already has more than 170 members and over 900 committers based in Europe. The formalisation of the Eclipse Foundation AISBL non-profit association will help it to leverage its EU presence and recent international growth to foster global industry collaboration on open source projects in strategic technologies. This includes the cloud, edge computing, artificial intelligence, connected vehicles, telecommunications, and the Internet of Things.
