

8 Windows Subsystem for Linux (WSL)

This open source tool for Windows sysadmins is a new feature of Windows 10. Developers who build Web apps or work on open source projects can run native Linux command-line tools directly on Windows with the help of this tool. Windows Subsystem for Linux (WSL) uses Bash, different command Linux tools, and other Linux tools such as Ruby or Python so that the toolchain on Windows can be used. Windows users can also run real Ubuntu realspace with this tool.

Features

- Developers can use the Linux command-line tool on Windows.
- It is a combination of Ubuntu Linux for Windows.
- Users can use the toolchain on Windows.

9 Cordova

This open source tool for Windows sysadmins is free and sponsored by Apache. Cordova is used to develop mobile apps with JS, CSS and HTML. This open source tool helps a developer to build apps for various platforms such as iOS, Windows, FireOS, Android, LGwebOS, etc. Cordova can wrap an app in the native container that can access device functions of different platforms.

Features

- Cordova has a command line interface.
- It offers core components for building a base of the app.
- It has a good set of plugins.
- Cordova has an Apache license.

10 Wireshark

This open source packet analyser for Windows sysadmins is free and used for analysis, network troubleshooting and the development of communications protocols. The original name of Wireshark was Ethereal, but it was renamed in May 2006 because of trademark issues. It has a terminal-based version called TShark, and has been released under the GNU General Public License. Wireshark can be operated on Linux, Windows, BSD, Solaris, and macOS.

Features

- It can capture raw USB traffic.
- There are various filters that offer the facility to filter the captured traffic's output.
- Users can create plugins to dissect new protocols.
- Users can read live data from different types of networks **END**
