

Figure12: coronavirus\_tracker project architecture

Figure 13: Home page

Figure 14: Covid-19 data

Figure 15: Country page: India

*MyDataRow* and *CountryPageData* Row classes provide a way to use title and data as a single widget, with desirable constant configurations like *textColor*, *fontSize* and *FontWeight*.

## Screenshot of coronavirus\_tracker on iPhone 12 Pro – Max 14.2

You can initialise the app with the *HomePage* screen, as shown in Figure 13. Users can scroll through the Covid precaution images from the featured section and can tap on the *Refresh* button to get the Covid-19 data of the world. They can also select a country from the grid list given, to get the Covid-19 data of that country.

Every country's data card has a 'more...' button, which navigates to a country page of that card. For example, if a user taps 'more ...' on India's card (Figure 14), the app will navigate to a page containing more details about our country (Figure 15).

Developers can build the apk and distribute the .apk file directly for use. They can also update the necessary details like app icon, package name, etc, and publish the app on stores. As this is just the tip of the framework, you can visit *Flutter.io* [<https://flutter.dev/>] to check the documentation to get more information. The Flutter team has also been innovative in publishing short YouTube videos [<https://www.youtube.com/channel/UCwXdFgeE9KYzIdDR7TG9cMw>] on every widget. To explore Flutter libraries, visit <https://pub.dev/>. Developers can use *dartpad* to play with the Dart programming language on any current Web browser.

The source code for this project is available in our Git repository [Ref: [https://github.com/t-phenix/coronavirus\\_tracker](https://github.com/t-phenix/coronavirus_tracker)]. END 🐧
