

teams software to manage experiments, orchestrate their workloads across computational resources, and manage the data that drives their machine learning experiments -- all in one clear interface.

Nir Bar-Lev, CEO and co-founder of Allegro AI, said, “We’ve seen huge growth in users and usage over the past year, and we’re excited to start off 2021 with a new brand name and now with an even easier way to get started. Our user base is skewed towards organisations leading in AI adoption that require the most sophisticated toolset. With our managed service offering of ClearML, individuals and small teams just getting started can now get going with zero friction.”

Allegro AI’s software has been available as a free self-hosted open source application and as an officially-supported enterprise-grade app with support and custom integrations. Now it is also available as a ‘0 code’ implementation for data scientists to use in their existing workflows.

Cigniti Technologies teams up with Sonatype to enhance DevOps further

Cigniti Technologies has announced a partnership with Sonatype, the company that scales DevOps through open source governance and software supply chain

automation. Both companies will work to help enterprise customers innovate faster and mitigate the security risk inherent in open source.

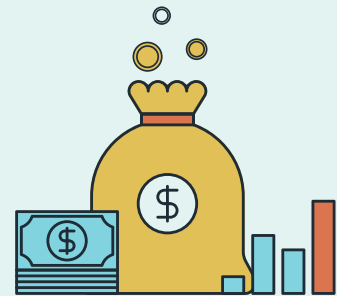

By teaming up with Sonatype, Cigniti is able to offer its clients the powerful Nexus Platform, enabling them to automatically enforce open source governance and control risk across every phase

of the software development lifecycle (SDLC). Fuelled by Nexus Intelligence, which includes in-depth security, licence, and quality information on more than 100

CloudLinux to invest US\$ 1 million annually in development

CloudLinux has announced that it will invest US\$ 1 million annually in development and establish a community initiative around its RHEL fork intended as a safe haven for CentOS users. It added that it will give current users a trusted, battle-tested alternative supported by a governing board from members of the community.

CloudLinux is sponsoring Project Lenix, which will create a free, open source, community-driven, 1:1 binary compatible fork of RHEL 8 (and future releases). It said that it will provide an uninterrupted way to convert existing CentOS servers with absolutely zero downtime. Entire server fleets will be able to be converted with a single command with no reinstallation and no reboots required.

Igor Seletskiy, CEO and founder of CloudLinux Inc., said, “RedHat’s announcement has left users looking for an alternative with all that CentOS provides and without the disruption of having to move to alternative distributions. We promise to dedicate the resources required to Project Lenix that will ensure impartiality and a not-for-profit community initiative. CloudLinux already has the assets, infrastructure and experience to carry out the mission, and we promise to be open about the process of developing Project Lenix.”
