The following features further enhance the utility of Redis:

- Built-in replication features
- Transactions
- Various levels of persistence
- Lua scripting
- Automatic failover

Another essential attribute of Redis is its ability to be used along with various programming languages. Complete details about different clients on specific programming languages are given in the official documentation at <https://redis.io/clients>.

Redis is built using ANSI C. It works without any external dependencies on various platforms such as BSD, Linux and OS X. Official documentation recommends using Linux for deploying Redis. As per the documentation, official support is not available for the Windows OS. Redis releases are available in three different versions:

The core feature of Redis is the key-value store. Redis is made efficient by allowing different data structures to

store values. On top of this, atomic operations are provided for these data structures to enable effective processing.
