

Why We Need Fingerprinting Tools for Android Apps

Smartphone users generally keep their data and personal information on the cloud and access it through different apps. This poses a threat to the security of personal data, especially when a smartphone app seems to have suspicious code. This article covers a couple of tools for fingerprinting and forensic analysis of Android apps.

All of us use smartphone apps for personal and official work or for accessing social networks. Research reports indicate that many apps are dangerous and could lead to data leakage. Android is a popular smartphone platform that is used for thousands of apps. A *Statista.com* report indicates that there are 3.5 billion smartphone users in the world. Of these, 87 per cent have Android smartphones.

Cases of sniffing attempts in Android apps

Companies working rigorously on security and privacy spend huge amounts of money so that secure anti-malware can be released for Internet users. As per a report by *CPO Magazine*, cyber-attacks will cost around US\$ 6 trillion in 2021. The loss was valued at US\$ 2 trillion in 2019.
